INDEX TO VOLUME XLIX.

Illustrated articles indicated by *.

A.

Abendroth Bros., New York City, Mar 5, p 43
Acetylene cartridges, Lighting with, Mar 26, p 41
Acetylene gas:
  City lighting by, June 18, p 31*
  Ontario, Lighting of, May 7, p 29
  Piping old houses for, Feb 12, p 36
Acetylene gas engines, June 4, p 43
Acetylene gas generators:
  Criterion, June 4, p 32*
  Troubetzkoy, June 4, p 31*
Acetylene gas regulations, June 15, p 31
Advertising lamp, Design for, Apr 16, p 29*
Agate ware, Repairing, Mar 12, p 33; Apr 2, p 36
Ahern, James. Attitude of the master plumbers toward associations, local, state and national, Feb 19, p 41
Ahrens & Ott Mfg. Company, May 21, p 28
Ainge, T. S. Plumbing classes in England and in the United States, Mar 20, p 41
Air, Liquefaction of, Apr 16, p 27
Air compressor, Size of, June 4, p 28
Albany Master Plumbers' Association, Mar 5, p 41
Alger & Macfarlane, Boston, May 7, p 37
Allingham hot water heater, Mar 26, p 35*
Aluminum:
  Action of mercury on, Feb 26, p 29
  Comparison of, with other metals, Mar 26, p 44
  Electro deposits on, June 4, p 26
  Making, at Niagara Falls, Apr 30, p 34
Aluminum camp outfit, Jan 29, p 50*
American base box system, Jan 8, p 43
American Protective Tariff League, Jan 29, p 53
American roofing slate in 1897, Jan 22, p 41
American Society of Heating and Ventilating Engineers, Jan 22, p 36; Feb 5, p 35*; Mar 7, p 32
Ancient metal workers, Mar 12, p 46
Anglo-American Chamber of Commerce in Belgium, May 21, p 26
Annealing of cast iron, Feb 5, p 48
Anthracite coal, Statistics of 1897, Jan 29, p 32
Antimony, United States production, Jan 29, p 32
Apple parer, The turn table '98, June 4, p 47*
Apprentices in the plumbers' trade, Mar 26, p 34
Arkansas Master Plumbers' Association, Feb 19, p 41; Mar 26, p 34
Armstrong pipe machine with power attachment, Mar 26, p 34*
Art Relief Co., Covington, Ky., Apr 23, p 30
Ash remover and automatic sifter, Campagna, Feb 12, p 52*
Asparagus or corn boiler, May 7, p 40*
Australian Trade School, May 14, p 25
Avery Klondike mess pan or camp outfit, June 18, p 49*
Avon instantaneous water heater, June 18, p 29*
Ayars rapid vise, Feb 5, p 41*

B.

Babcock Hardware Company, Feb 5, p 44*
Bake pan, Ideal double, Mar 26, p 47*
Baker eave trough hanger, Mar 12, p 47*
Baltimore Master Plumbers' Association, Feb 12, p 41
Baltimore Master Plumbers' Mutual Protective Association, Mar 12, p 43
Baltimore resolutions, Sale of plumbing goods. Apr 16, p 37
Baltimore Trade School, Apr 23, p 26
Bankruptcy bill, June 11, p 26
Barker, Rose & Clinton Company, Jan 29, p 48
Barn roof sweats, Jan 1, p 33; 8, p 33
Barnes Mfg. Company, June 25, p 49
Base box system, American, Jan 8, p 43
Baskets:
  Coal or coke, Jan 1, p 60*
  Utility steel, Feb 12, p 48*
Bath and laundry tub combined, Mar 19, p 33
Bath house, Public Lowell, Mass., May 7, p 29
Bath seat, Universal, Mar 26, p 36*
Bathtubs:
  Horton tub and washer, Jan 29, p 50*
  Wilson enameled, Feb 5, p 39*
Bay City Master Plumbers' Association, Officers, Feb 19, p 43
Bay window, Making the bottom of, Feb 5, p 32*
Beam clamp, A B C, Jan 29, p 43*
Beef shaver, Enterprise rotary, May 14, p 48*
Bell stirrer and aerator for milk, May 7, p 39*
Bench, The "man killing" (?), June 4, p 43*
Bending rolls:
  Bertsch improved, Jan 8, p 53*
  Wais & Roos, Mar 26, p 40*
Bentz's new enamel, Jan 22, p 33
Berger Mfg. Company, May 28, p 28; June 25, p 31
Bergstrom Bros. & Co., June 18, p 42
Bicycles in United States and Europe, Jan 22, p 31
Binghamton Master Plumbers' Association, Jan 15, p 34
Blackmore, J. J. Proportioning of circulating pipes for steam and hot water heating systems, Jan 29, p 44
Bliss, E. W. & Co.:
  Automatic screw machine, Apr 16, p 46*
  Double crank press, Feb 26, p 33*
  Drawing press, Special toggle, May 14, p 34*
  Straight sided press. Mar 26, p 50*
Blower pressure, Question of, Apr 9, p 31
Blowers:
  History of the blower system, Mar 19, p 35*; Apr 9, p 35; 16, p 38; 30, p 30
  Sturtevant, Apr 9, p 45
  Uses of, in the foundry, Feb 12, p 50
Boats, Sheet metal, Mar 19, p 33
Boiler trade of 1897, Jan 1, p 43; Apr 30, p 29
Boilers:
  Accidents to, Feb 26, p 36
  Allingham, Mar 26, p 35*
  Bundy, Jan 15, p 32*; Feb. 5, p 39*; June 18, p 30
  Care of steam, Feb 19, p 39
  Cheap, on the market, Apr 9, p 37
  Cold weld range, Apr 23, p 36*
  Doric heating boiler, Jan 22, p 35*
  Exeter, Apr 9, p 38
  Floral City, May 28, p 38; June 18, p 33*
  Gasoline, Feb 12, p 41*
  Gorton, Feb 12, p 40; June 4, p 33
Boilers (Continued):
  Gurney, Apr 23, p 38
  Kellog, McKay-Cameron, June 18, p 32
  Kewanee, May 14, p 31
  Magee, June 4, p 34*; 25, p 44*
  Mechanical draft, Influence of, Apr 9, p 40*
  Palace Regent solid safety, Mar 12, p 40*
  Paragon house heating, May 7, p 32
  Peerless heating, Feb 26, p 38*
  Pierce, Butler & Pierce, June 18, p 32
  Plummer sectional, June 25, p 45
  Prices low, Mar 26, p 37
  Range:
    Connecting with carving table, Jan 15, p 28
    How to generate steam in, Mar 5, p 35*
  Rating, Rule for, Jan 29, p 33; Apr 30, p 28; May 14, p 27
  Richmond, June 11, p 45
  Roberts, Charmer, Apr 30, p 32*
  Setting vertical horizontally, Feb 5, p 31*
  Softening feed water for, May 28, p 27*
  Standard, June 18, p 32
  Vance, Apr 2, p 41
  Water back too large, Mar 5, p 37
  Water to boiler surface, Mar 12, p 33
Bolt or rivet cutters, Jan 15, p 41*
Bonnet-Nance Stove Company, June 11, p 35
  New foundry, Chicago Heights, Mar 12, p 50
Book reviews:
  Copper Manual, Jan 1, p 60
  Hardware Estimates for Buildings, B. H. Jessup, Apr 9, p 48*
  Hot Water Fitters' Text Book, T. E. McNeill, Mar 26, p 36
  Machinists' and Engineers' Pocket Manual, D. B. Dixon, Apr 23, p 28
  Mechanical Heating and Ventilation, M. C. Huyett, Mar 19, p 34
Boring machine and boiler drill and radiator, Jan 15, p 32*
Boynton Furnace Company, Apr 9, p 52
Brace, McClellan universal, Jan 15, p 36*
Bracket, Frand ornamental, June 4, p 36*
Bradley & Co., New Haven, Conn., Apr 30, p 32
Brake, Range manufacturers' new open end, Jan 8, p 47
Brand Stove Company, Hotel kitchen outfits, May 7, p 45
Brass, Demand for, June 4, p 28
Brass Works, Turner, June 25, p 30
Brazing furnace, Hull improved, Feb 19, p 36*
Brooklyn Master Plumbers' Association, Jan 15, p 34
Broom lock, Pirrung combination, June 4, p 47*
Buck's Stove & Range Co., Apr 30, p 45
Buckeye dish washer, Feb 26, p 38*
Buffalo angle shear, Mar 19, p 51*
Bug exterminator, Uncle Sam sprayer, Jan 29, p 49*
Building trade:
  Baltimore, Apr 9, p 45
  New York City, Troubles of, Apr 23, p 25
Buildings, Sheet iron, in construction, June 25, p 32*
Bulkheads, Iron framing of, Mar 26, p 42*
Bundy exhaust pipe head, Mar 12, p 43*

Buoy, Electric lighting, Wave Power, Apr 23, p 28
Business failures, United States, 1897, Jan 8, p 31
Business generation, A, May 21, p 23
Business methods:
  Discount, Question of, May 14, p 27
  Figuring, Uniform method, Feb 12, p 36
  Method for obtaining weekly shop costs, Jan 8, p 45
  Rules to encourage cash business, June 25, p 49
Business situation:
  Activity in all lines, Feb 12, p 27
  Cheerful tone in business circles, May 21, p 23
  Encouraging, Mar 12, p 31
  Excellent volume of current business, Feb 5, p 29
  Growth of trade, Mar 19, p 29
  Inactivity, Jan 8, p 31
  Large volume of trade, June 4, p 25
  Manufacturers' large outputs, Apr 9, p 29
  Possibility of war affects trade, Apr 23, p 25
  Prices steady, Jan 29, p 31; June 11, p 25
  Quiet confidence in business outlook, Jan 15, p 27
  Review of 1897, Jan 1, p 31
  Slackening in trade, Apr 9, p 29
  Southern prosperity, Jan 15 p 27
  Steady and satisfactory improvement, Feb 19, p 29
  Steady increase in trade, May 28, p 25
  Substantial basis for great expectations, May 28, p 26
  Summary of February, Mar 5, p 33
  Upward tendency, Jan 22, p 31
  War, Effect of, Mar 26, p 29; Apr 2, p 31; 30, p 25; May 7, p 25; 14, p 25
Butler, W. R., Speech at stove convention banquet, May 28, p 46

C.

Camp outfits:
  Aluminum, Jan 29, p 50*
  Avery Klondike mess pan, June 18, p 49*
Can making plant, Automatic, Jan 22, p 32
Can openers:
  Cyclone, Apr 23 p 40*
  Dean, Jan 8, p 41*
  Klondike combination, Mar 5, p 50*
  Magic, June 4, p 47*
Canadian Master Plumbers' Association, Feb 12, p 42
Canning industry:
  California, Mar 19, p 45; Apr 9, p 32; June 4, p 39
  United States, Feb 19, p 44
Caracas sample warehouse, Venezuela, Exhibitors at, Apr 7, p 27
Carbide situation, June 18, p 29
Carbonic oxide and red hot stoves, Mar 26, p 48
Carpenter, B. H., Heating and ventilating church and parish building by forced draft, Feb 5, p 37*
Carpet beater, Ludlow-Saylor, Apr 23, p 41*
Cars, Metal sheathing for, Feb 19, p 35
Carving table, Connection with range boiler, Jan 15, p 28*
Cast iron:
  Action of sea water on, May 7, p 28
  Annealing of, Feb 5, p 48
  Tinning of, Mar 19, p 32
Castings:
  Coppering iron castings, Apr 9, p 31
  Old, Found in New York City, Apr 30, p 44
Castle, C. H., Portrait, May 21, p 39*
Ceilings:
  Design, Ornamental Stamping Works, June 11, p 29*
  Metal:
    Berger Mfg. Company, June 25, p 31
    Iron City Mfg. Company, May 28, p 28*
Chattanooga Master Plumbers' Association, Officers, Jan 15, p 34
Chicago Master Plumbers' Association, Officers, Jan 1, p 46; 8, p 38; 29, p 42; Mar 26, p 38
Chicago Master Plumbers' Protective Association, Officers, Mar 12, p 43
Chimney base, Short rule for, Mar 19, p 48*
Chimneys:
  Church, Boiler connections, Apr 2, p 36*
  Questions concerning, Mar 5, p 37
Chinaman as a business man, The, June 4, p 28
Churches:
  Chimney or boiler at fault? Apr 16, p 28; 23, p 28; 30, p 27; May 7, p 27; 14, p 27
  Heating and ventilating by forced draft, Feb 5, p 37*
  Heating and ventilating system, June 25, p 34
Churn and ice cream freezer, Combination, Mar 5, p 48*
Cincinnati Master Plumbers' Association, Jan 15, p 34
Circuit fitting, Schlemmer, June 25, p 44
Circulation, Steam, Some experiments in, Jan 29, p 41
Clamp, Climax steam joint, Apr 2, p 41
Clark, Geo. M & Co., June 11, p 34
Clark, H N. Company, May 14, p 48*; 28, p 46
Clark's supply house, Unique letter head, Jan 8, p 42*
Clean out, Boston, Jan 22, p 38*
Cleveland Retail Hardware Association, Apr 9, p 47
Climax steam clamp joint, Mar 5, p 42
Clothes line holder, Cleveland, June 25, p 50*
Clothes sprinkler, Maltby novelty, June 11, p 46*
Coal:
  Anthracite, Statistics of 1897, Jan 29, p 32
  Proportion of, to radiation, May 21, p 25; June 4, p 27
  Western trade, Feb 5, p 29
Cocks:
  Basin, New low down self closing, Mar 19, p 38*
  Ball, B. B. high pressure, June 4, p 31*
  Field self closing, June 4, p 30*
  Ryan's Boston safety, Apr 9, p 38*
  Stop and waste:
    Anti-freezing, Mar 19, p 39*
  Simplex, Jan 8, p 36*
Coffee mill, Brighton special, June 4, p 47*
Coffee pot with copper rim, June 4, p 47*
Cole Mfg. Company, May 14, p 45
Comstock, F. R., Kitchen of the modern house, June 18, p 26
Connecticut Master Plumbers' Association, Feb 19, p 38
Connecticut State Association of Master Steam and Hot Water Fitters, Mar 19, p 40
Contraband of war, May 7, p 38; 14, p 28
Cooking:
  Buzzacott's portable equipment, Mar 19, p 43*
  Coal and gas for, Comparisons, Mar 19, p 49
  Electricity *vs.* gas, Feb 19, p 57
  Sherman House, Chicago, Mar 19, p 49
Cope, G. W., Review of the stove trade, Jan 1, p 34
Copper, World's production, Apr 16, p 25
Copper valleys, Laying, Feb 19, p 32; Mar 5, p 37
Copper ware, Retinning old, Apr 9, p 30
Coppering iron castings, Apr 9, p 31
Cornices, Copper, How to color, May 7, p 27
Cornucopia, Six-sided, Pattern for, Apr 9, p 42*
Corrosion of lead pipe, Cause, Apr 16, p 30
Cost mark, Cipher, Apr 9, p 49
Costs, Method for obtaining weekly, Jan 8, p 45
Cotton seed oil, Mar 5, p 36
Couch eave trough hanger, June 25, p 31*
Cribben, Henry, Portrait, May 21, p 39
Crimpers:
  Bertsch, May 21, p 36*
  Cornice crimping rolls, June 4, p 38
  Rudolphi & Krummel's double head, May 14, p 34*
  Wheeler's lighting, June 18, p 46
Criterion acetylene gas generator, June 4, p 32*
Culloton, T. P.:
  Address at convention of master plumbers, Apr 23, p 33
  Testimonial to, May 21, p 30
Culter & Proctor Stove Company, June 25, p 37
Curry comb, Ringed shank, Feb 5, p 43*
Cylindrical vessel, Rule for finding the contents in gallons, Apr 2, p 36

D.

Damage suits, Personal, Frequency of, Jan 1, p 32
Dean, Mark, Single pipe low pressure steam heating systems, Jan 29, p 42
Department stores, Wisconsin, Feb 12, p 47
Detroit Galvanizing & Sheet Metal Works, Apr 23, p 44
Detroit Master Plumbers' Association, Jan 15, p 34
Devlin, Thos. & Co., June 18, p 33
Dickelman-Bowers Mfg. Company, successors to Rhodes, Dickelman & Co., Jan 22, p 42
Dipper, Glass, June 4, p 48*
Dish washer, Buckeye, Feb 26, p 38*
Door mat, American steel, Apr 30, p 37*
Doyle, William, Death of, Mar 26, p 48*
Drier, Hot water, Improving circulation in, Jan 22, p 45*
Drill stock, Whitney's improved ratchet, June 4, p 30*
Drills:
  Bickford drill and boring machine, Jan 15, p 32*
  Champion black diamond blacksmiths' self feed post, Feb 19, p 30*
  Porter hand power, Mar 19, p 40*

E.

Earth:
  Curvature of, Apr 16, p 28
  Power required to lift, June 4, p 38
East, The changing, Apr 16, p 25
Eave trough hangers:
  Baker, Mar 12, p 47*
  Bell twisted wire, Mar 26, p 43*
  Couch, June 25, p 31*
Egg beater, Dover steel handle, Apr 9, p 50*
Egg poacher, Maryland, Apr 16, p 42*
Egg separator, Centaur, June 4, p 49*
Egyptian pyramids, Electric lighting of, Apr 16, p 25
Elbows:
  Pattern for furnace pipe, Apr 30, p 41*; May 7, p 37
  Universal one-piece, June 18, p 48
Electric Gas Lighting Company, Apr 2, p 47
Electric power from sea waves, May 14, p 26
Electric power in Buffalo, Charging for, May 7, p 43
Electrical goods as a profitable stock, Apr 30, p 37

The Metal Worker

A WEEKLY JOURNAL OF THE ROOFING, CORNICE, STOVE, TIN, PLUMBING AND HEATING TRADES.

With which is Incorporated The Stove and Tin Trade Journal, the Sheet Metal Builder, and Metal.

VOL. XLIX. NUMBER 1. | NEW YORK AND CHICAGO, JANUARY 1, 1898. | ONE DOLLAR A YEAR. SINGLE COPIES, 5 CENTS.

WHY

have so many stove and furnace makers renewed their contracts for 1898 for the

American Seal.

BECAUSE

it is the best STOVE PUTTY and FURNACE CEMENT in the market.

Always uniform in quality.
It stands more heat.
It gives better satisfaction.
Can I send you a sample barrel?

A WELL BRED FURNACE

is the best advertisement you can put into the houses of your customers. It will speak for you every day, and speak well of you.

The Paragon Furnace

is the only furnace we know that always gives satisfaction. You know that any customer you have that is worth having can be made to see that it is better to pay a fair price at the start for the Paragon than indulge in false economy and swear every time he opens a damper.

EXCELSIOR STRAIGHT-WAY BACK PRESSURE VALVE

This valve has no dash pots, springs, guides or complicated levers to get out of order. It is simple, reliable and well made. Never sticks, and can be relied upon at all times when using exhaust steam for heating; or when used as a relief, or free exhaust on a condensing plant, it has no equal. It is noiseless and free from any complicated attachments.

JENKINS BROTHERS, New York, Philadelphia, Boston, Chicago.

Hot Water & Steam Boilers & Furnaces.

OUR NEW

Carton "F" Series.

GERKEN & NEIPP,
Sales Agents "CARTON" Furnaces.

TOLEDO, OHIO, Dec. 21, 1897.

Messrs. GERKEN & NEIPP.

DEAR SIRS :—The **Carton** Heater placed in my **14-room residence** has far exceeded my expectations and your claims. The bare fact of its only consuming 8 **tons of coal,** a **saving of 50 per cent.** in my **coal bill,** is a practical illustration of an important point of merit over all other heaters. Its **ease** of **management,** freedom from **gas** and **dust** are commendable features. It is a **quick, sharp Heater** and easily controlled. In my experience with other heaters I emphatically pronounce the **"Carton" far ahead of all others.**

Yours truly,
R. W. SUSSMAN.

HATBORO, PA., Dec. 26th, 1896.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR:

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal.

Very truly,
I. N. EVANS.

A Happy New Year

A Happy New Year

A Happy New Year

Two Leading Ranges

. . . FOR 1898 . . .

THE "HOME CRAWFORD" surpasses everything. Has more new features than any stove for twenty years. Square oven, same size top and bottom. A single damper instead of two as usual. Three grates: plain, triple and improved dockash; fit same bed plate without removing linings. The plan of attaching dockash cogs is the best yet. The fluestrip over the oven has cup joints. Triple heat-saving oven-back, asbestos filled. The design combines richness, elegance and an appropriate extent of plain surface. The nickeled edges are curved; the result is very pleasing. We supply waterfronts, coils, wood-fixtures, reservoirs, tea-rails, mantels and high closets. Patents for the design and all mechanical features are pending.

THE "PRINCE CRAWFORD" is our "wedge." It is the most popular medium-priced stove. Brilliant in style and finish; correct in construction; perfect in all details. The most successful stove-dealers have found this range profitable. All sizes, either wood or coal, with reservoirs, mantels and high closets.

CONSIDER CRAWFORD Ranges for the new year. They will make you happy. Send your name for catalogue now in preparation.

A Happy New Year

THE PRICE OF GASOLINE HAS BEEN REDUCED.

NOW IS THE TIME TO SECURE THE AGENCY FOR

The "New Process" Evaporating Gasoline Stove.

A STOVE THAT LIGHTS LIKE GAS.

A STOVE THAT IS PERFECT IN EVERY DETAIL.

A STOVE THAT IS ABSOLUTELY SAFE.

No Drip Cup to Overflow and cause trouble.

RESERVOIR CANNOT BE FILLED WHILE THE BURNERS ARE LIGHTED.

****

Why have the housewife swelter in a hot kitchen, carry coal and ashes when she can have *comfort* by using a "NEW PROCESS" Stove—the *handsomest* piece of stove furniture made?

Send for Catalogue and secure the agency early.

****

MANUFACTURED ONLY BY

The Standard Lighting Company,

100-120 Perkins Ave., CLEVELAND, OHIO.

1898.

To accommodate the increased demand for our product, we have found it necessary to add to our already extensive works. This new addition, just completed, will add to our capacity fully one-third, giving us one of the largest and best equipped Factories in this line in the United States, and will enable us to fill orders promptly, and at the same time can guarantee that everything will be of the best. Our line of

Gasoline Vapor and Evaporating Stoves and Ranges

will include our improved, celebrated "Gem" Vapor Stove, which, as now made, must become the leading stove in the market. We also make the Process, Single and Individual Burner Vapor Stoves of all styles and descriptions ; and our line of High and Low Juniors, including the Lay-down, the Removable and Stationary Tanks, which will in the future, as in the past, be the most popular in the market. We also call special attention to our celebrated line of

Blue Flame Oil Wick and Wickless Cook Stoves,

which are now in use in more than fifty thousand families throughout the United States, who all bear willing testimony of their durability, economy, simplicity, and quick-lighting, and dealers will find less annoyance and trouble in handling our lines than any other make. We are also pleased to call attention to our popular line of

Gas Ranges, Stoves, Hot Plates, Etc.,

which for quality, style and price are recognized as the most popular in the market, and, as heretofore, we shall continue to manufature ***Specialties,*** including our Combination Tinners' and Plumbers' Furnaces, Paint Burner, Blow Pipe, and Laboratory Lamps ; Gasoline and Oil Electric Torches, celebrated for their durability and quick-lighting.

We do not hesitate to believe that it will be to the interest of all dea'ers to confine their sales to our line of Vapor and Evaporating Gasoline, Blue Flame Oil, and Gas Stoves and Ranges, etc.

Separate catalogues for each line will be ready for mailing on or before the 15th of January.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

STEAM AND HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

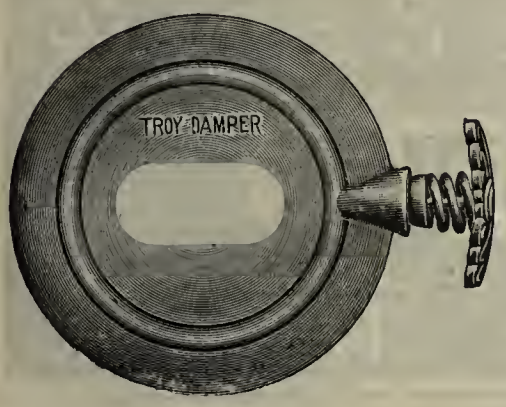
It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.



Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.

The Climax Ratchet Stock.

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00.

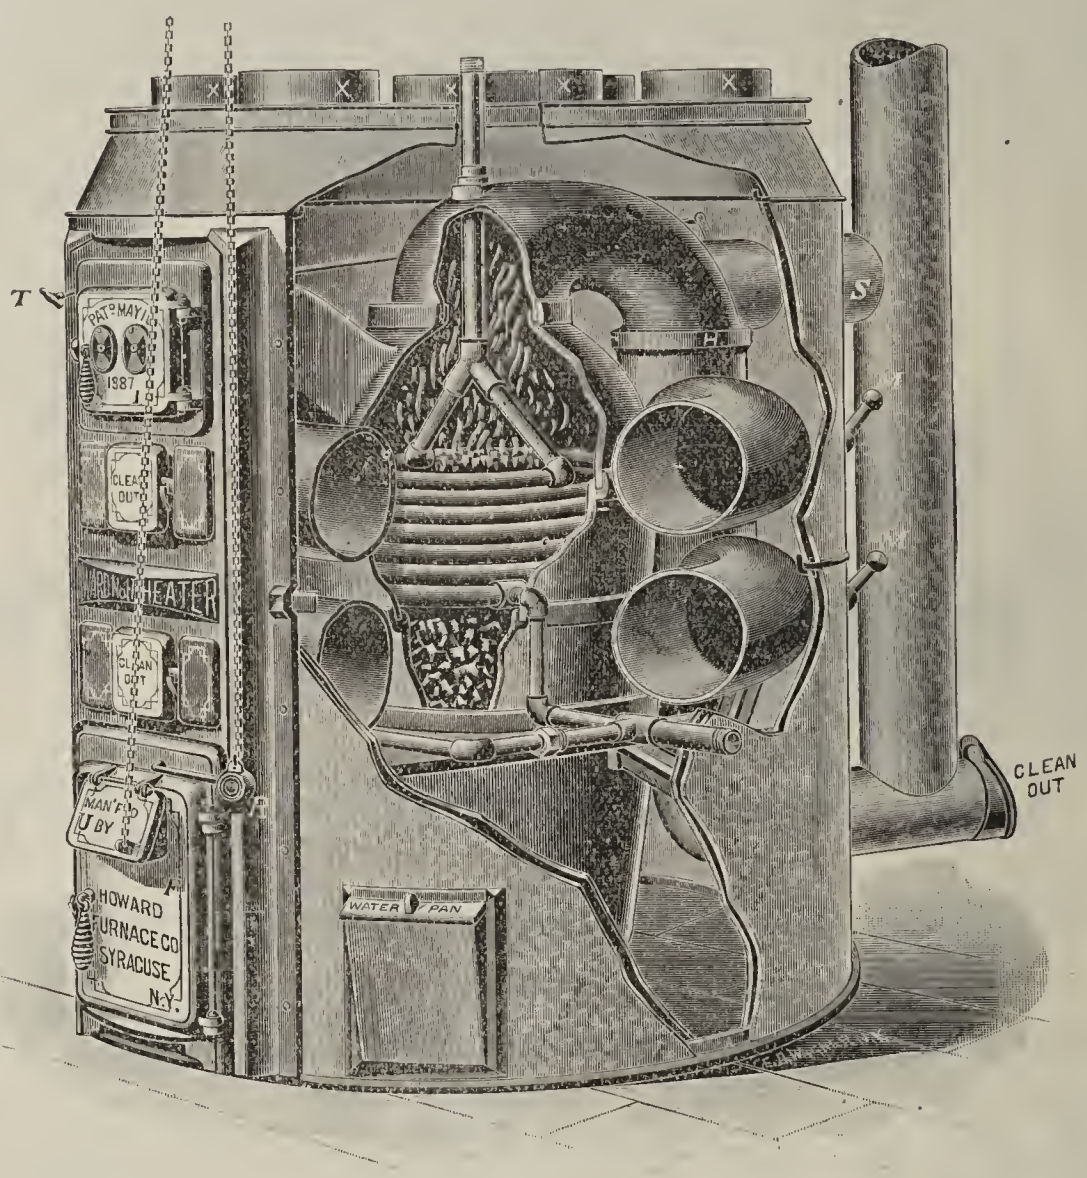
THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft.

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*

"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*



"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

DAVID WILLIAMS CO., Publishers, - 232-238 William St., N. Y.

After All Has Been Said

about the merits of different furnaces and after all that has been done to reach the highest pinnacle of perfection in their construction, there still remains certain well known and ascertained facts, certain principles of a distinctive quality which mark the one from the other as to their actual value and worth. It is this quality, this principle, that is shown which we talk about and prove.

About The Best

furnace we know of is the one shown in the above cut. As every dealer knows, every manufacturer of furnaces makes the same claim. That's business. But granting that every furnace made heats, the economical feature is in many instances lost sight of. The most practical illustration of fuel saving is concentrated in the two hollow radiators which encircle this particular style of furnace.

Index to Reading Matter.....Page 67.

Past, Present and Future.

The generous response to our letters of inquiry sent out to the several trades *The Metal Worker* represents is evidence of the interest our readers take in the reviews we have published in our first January issues for a number of years past. The more important trades are dealt with at length in their proper departments, and whoever will take the trouble to read the summaries and the letters that accompany them will gain a trustworthy knowledge of the course of business in these lines during 1897 and learn what views are held concerning the prospects for the new year we are entering upon. The summer and fall of 1896 was a gloomy and unsettled period to many, but with the end of the year the prospect brightened and the belief grew that 1897 would bring happier times in the industrial and commercial world. These hopes, however, did not reach an early fruition, and the months came and went in exasperating dullness. Not until well on toward the middle of the year was there any decided increase in activity, and even then it came from an unforeseen cause—the shortage of the grain crop abroad and the abundant harvest in this country. Prosperity returning to the agricultural classes, the manufacturers ministering to their wants became benefited by the increasing demand for their products and the volume of business grew to gratifying proportions. But the wished for advance in prices did not come; nor is this so much to be wondered at when it is considered that manufacturers had been on short rations so long and were desperately hungry for the smallest slice of trade. This is what the record of the year shows: A dull trade in the beginning, a good trade later and stationary prices with only a moderate profit to carry over into 1898. Of course, this is not the year's history for every individual or for every trade, but from the returns we have received it is a fair presentation of the year in all the industries we represent. The better conditions prevailed most noticeably in the West, and the Atlantic States and New England States have not as yet had their full share of the benefit, while in the South the low price of cotton and the yellow fever conspired to keep business dull and profitless. Turning now from what has gone to what is to come, we pass from fact to guess work, and perhaps we cannot do better than to repeat the candid confession of one of our correspondents, and say that "we are neither prophets nor sons of prophets." It is gratifying, however, to note that most of those who have written us speak hopefully, though not enthusiastically, of the outlook, and the general belief seems to be that the new year will bring a fair trade and not unlikely a moderate advance in market values. We join our readers in hoping that this will prove an understatement rather than an overstatement, and that 1898 will bring increased prosperity, wider margins of profits, and to one and all a Happy New Year.

The Result of Sanitation.

Three years back New York City began a movement for the systematic inspection of the tenement house districts and for a more rigid enforcement of all sanitary laws affecting them. At the same time Col. George E Waring undertook the task as Street Cleaning Commissioner of introducing, for the first time, a thorough system of street cleaning. Two years ago the State Legislature passed a law empowering the Health Department of the city to condemn and demolish all the "rear" tenements and to force the owners of the "rookeries" and unsanitary dwelling houses to carry out the repairs necessary to make them wholesome and fit for habitation. Appropriations were made, too, on a large scale for the laying out of public parks in the crowded districts and for the building of recreation piers on the river front. All these desirable reforms have been carried out or put in train, and the improvement in the health of the city has been remarkable in consequence. Figures recently published by the New York Health Department giving the deaths and mortality rates of the city for the first eleven months of each year since 1891 bear eloquent testimony on this line. They are as follows:

Year.	Deaths.	Death Rate.
1891	39,925	26.24
1892	41,113	26.26
1893	40,959	25.44
1894	38,123	22.99
1895	40,135	23.30
1896	38,803	21.89
1897	35,794	19.62

It will be seen that the deaths this year were actually 5319 less than for the corresponding period of 1892. But these figures do not represent the actual measure of improvement, for there has been a very considerable increase in population in the interval. Taking the average rate of yearly increase in population, the gain of human life this year in New York City, on account of better sanitary methods, clean streets, &c., must be about 13,500. The results accomplished are little less than wonderful, considering the short time in which the sanitary reforms have been in operation.

One very notable event of New Year's Day, 1898, is the coming into existence of the Greater City of New York, with a population equal to that of thirteen of the new States and Territories, whose area is 3000 times greater than that of the city. The annexation of the city of Brooklyn and a large territory on Long Island, Staten Island and above the Harlem River to the original city of New York creates a great metropolis of 3,200,000 population, with an area of 360 square miles, second only to London among the cities of the

world. The assessed value of real estate in the enlarged city is $2,264,142,968, and the value of personal property $397,076,668. Its manufactures employ 635,000 workmen, who are paid about $400,000,000 a year in wages. The growth of the new city from the time, in 1626, when the Dutch purchased Manhattan Island from the Indians for $24, to the present, when land in the greater city is worth on an average $125,000 an acre, or about 50 cents a square foot for the entire 360 square miles, is a remarkable one.

Frequency of Personal Damage Suits.

Personal damage suits against manufacturers, says *The Iron Age* are steadily growing more frequent. In one of our large cities it is stated that almost the entire time of one court is taken up in the trial of causes of this origin. It is not on account of the more dangerous character of the machinery used, nor is it because of a natural increase in the number of accidents to correspond with the growth of manufacturing industries. It is to be attributed partly to the fact that damages have been collected in some instances of personal injury, and others are thus incited to sue, and partly to the efforts of lawyers to secure clients and fees. In almost any instance in which a report of an injury to a workman is printed in the daily papers, the ink is hardly dry on the edition before attorneys appear who advise a suit, with no charge for their services unless successful. The employer is almost invariably called on to defend himself in court, at a waste of much time and perhaps considerable money, whenever a workman is hurt about a factory. An instance of this occurred quite recently. Some gasoline exploded while a gasoline engine was being tested in a shop, and a workman was so scared that he jumped out of a window and injured himself seriously. He sued the owner of the factory for $10,000 damages, but was beaten. The jury evidently believed that he should not have jumped, and that he did it at his own risk. Although the employer was not mulcted in damages, his outlay was probably quite heavy for attorneys' services and other legal expenses. This is the annoying phase of the matter. In attempting to dispense justice, our courts frequently do much injustice.

The Foundrymen's Defense Association.

The committee appointed at the meeting of the foundrymen in New York December 1 to prepare a constitution and by-laws for the proposed Foundrymen's Association that is being organized to facilitate the equitable adjustment of labor questions held a meeting in that city December 15 at the house of the American Society of Mechanical Engineers. A constitution and by-laws was drafted that it is confidently expected will meet with the approval of those who are expected to be interested in this new association. An address was also drawn up to be sent to a number of the leading employers of foundry labor in the country calling a meeting for the purpose of final organization January 26. This date was selected as a most desirable one because the National Association of Manufacturers meets in that city January 25, 26 and 27. A large number of the leading foundrymen of the country are sure to be in attendance, and reduced rates of fare will be granted by all the leading railroad systems of America. Fully 100 are expected at this meeting, which will be held in the club house of the American Society of Mechanical Engineers, 12 West Thirty-first street. Headquarters have been established at the Imperial Hotel, Thirty-second street and Broadway, New York.

The Coliseum, at Chicago, one of the largest public assembly halls in that city, and which covered 7½ acres, was destroyed by fire last week. The fire started from crossed electric wires.

Freight Rate Changes.

The Joint Traffic Association has issued the following recent circulars:

Rates on Pig Iron, Old Car Wheels and Axles, &c., Between Buffalo, N. Y., and the Niagara Frontier and Eastern Points.

Pig iron, in carloads, minimum weight 12 gross tons, to Buffalo, N. Y., and the Niagara frontier, effective January 10, 1898. New York (lighterage free, when permissible under current lighterage rules), $1.90 per gross ton, and New York (regular delivery), Philadelphia and Baltimore, $1.90 per gross.

Pig iron, in carloads, minimum weight 12 gross tons, from Buffalo, N. Y., and the Niagara frontier, effective January 10, 1898: Burlington, Vt., $2.30; Boston, Mass., $2.30; New York, N. Y., $1.90; Philadelphia, Pa., $1.90; Baltimore, Md., $1.90.

Old car wheels and axles, old rails, scrap iron and steel and scrap tin, in carloads, from Buffalo, N. Y., and the Niagara frontier, to Boston, Mass., and points taking same rates, $2.70 per gross ton. Between Buffalo, N. Y., and the Niagara frontier (in both directions), New York (lighterage free, when permissible under current lighterage rules), $2.30, and New York (regular delivery), Philadelphia and Baltimore, $2.30.

Westbound Rates on Pig Iron, Billets, Blooms, &c.

1. The duly authorized rates currently in effect upon pig iron, billets and articles taking billet rates, to wit: Blooms, borings, crop ends, ingots, muck or puddle bars, old car wheels and axles, old rails, scrap iron and scrap steel, scrap tin and slabs, also wire rods, sheet bars and tin plate bars, ingot molds, chain iron and pipe iron or pipe steel, in carloads, from the western termini of the Trunk lines and points taking same rates to points west thereof, on the basis of $2.20 per gross ton on pig iron, and $2.50 per gross ton on billets and articles taking billet rates (including wire rods, sheets bars and tin plate bars, ingot molds, chain iron and pipe iron or pipe steel), from Trunk line western termini to Chicago, be continued in effect after December 31, 1897.

2. Effective January 10, 1898, rates on pig iron, in carloads, minimum weight 12 gross tons, from points east of the western termini of the Trunk lines to Trunk line western termini and points west thereof, be established on the basis of $3.90 per gross ton New York to Chicago.

3. Effective January 10, 1898, rates on billets, blooms, borings, crop ends, ingots, muck or puddle bars, old car wheels and axles, old rails, scrap iron and scrap steel, scrap tin and slabs, in carloads, minimum weight 12 gross tons, from points east of the western termini of the Trunk lines to Trunk line western termini and points west thereof, be established on the basis of $4.50 per gross ton New York to Chicago.

4. Effective January 10, 1898, rates on wire rods, sheet bars and tin plate bars, ingot molds, chain iron and pipe iron or pipe steel, in carloads, minimum weight 12 gross tons, now in effect from specific points east of the western termini of the Trunk lines to specific Trunk line western termini and points west thereof on the basis of rates currently applicable upon billets, be established on the basis of the rates herein recommended on billets, in carloads—*i. e.*, $4.50 per gross ton New York to Chicago.

5. Effective January 10, 1898, if the duly authorized local rates on pig iron, billets and articles taking billet rates, wire rods, sheet bars and tin plate bars, ingot molds, chain iron and pipe iron or pipe steel, in carloads, from points east of the western termini of the Trunk lines to Trunk line western termini, plus the duly authorized rates upon said articles from Trunk line western termini to points west thereof, make lower combinations of rates than the duly authorized through rates on like traffic from Eastern points to Western points, it shall be permissible for the railway companies parties to the Joint Traffic Association to publish tariffs on said articles on the basis of such combinations of local rates from such Eastern points to such Western points.

The same rules have been established for the east bound rates on pig iron, billets, blooms, &c.

On ingot molds the east and west bound rates are established on the basis of $4.50 per ton of 2000 pounds New York and Chicago.

The United States Navy Department have signed a contract with the Maxim-Nordenfelt Company for 50 of the new 6 inch automatic Maxim-Nordenfelt guns for the battle ships. All of these guns will be made at the Washington Navy Yard, under a special arrangement with the patentees. The Maxim-Nordenfelt Company will supply the material, and the labor, which will be rendered by the regular navy yard employees, will be charged to their account. The present contract involves the first application of the automatic principle to guns of so large a caliber as six-pounders.

THE LETTER BOX.

List of Tin Plate Works.

From S. D. M., New York.—Please let me know the number of tin plate works in this country, their name, date of erection, size, output and, if possible, the number of mills in foreign countries, each country taken separately.

Answer.—Our correspondent has asked a rather comprehensive question. Respecting the works in the United States, we would refer him to another column of *The Metal Worker*, where he will find our quarterly report, giving a list of the mills and their sizes. Most if not all of these mills when built were mentioned in *The Metal Worker* at the time, but to gather this information would entail searching through our columns for several years back. Information about the Welsh mills can be obtained from a list published in the *Iron and Steel Trades Journal* of London, or if he wants more particular information we would refer him to "Ryland's Iron Trade Directory," published at Birmingham, England, a new edition of which is, we believe, shortly to be printed.

Barn Roof Sweats.

From the Allen Anti-Rust Mfg. Company, Cleveland, Ohio.—In response to the inquiry in *The Metal Worker* December 18 from "M. B.," Baraboo, Wis., in relation to condensation on the under side of a metal roof over an elephant barn, I beg to advise you that we have had large experience in the matter of all kinds of metal roofs, and the only effective remedy we have ever found for a case of this kind is to build an air chamber immediately under the roof, using matched flooring. In the United States Navy there is a remedy used where the steel ships have given a great deal of trouble by reason of sweating on the inside. Here they paint the inside of the metal with Allen's anti-rust japan, and while this paint is fresh they sprinkle it with cork dust, putting the cork dust on pretty heavy or as much as the paint will hold. This cork dust is like sawdust and in some instances ordinary sawdust is used for the same purpose. But our neighbor up in Wisconsin with the elephant house will probably find the only remedy in placing matched flooring forming an air chamber under the roof. Even then he will find it necessary to ventilate the upper part of his building.

From G. H. S., Wilmington, Del.—In answer to the inquiry of "M. B.," in *The Metal Worker* of December 18, in regard to a method for overcoming troublesome condensation, I would say that I have had the same thing to contend with and have used asbestos paper. In this case it should be fastened to the under side of the rafter with a tin cap the same as is used for tar roofing, nailing 6 inches apart, starting the paper at the bottom and running it up toward the deck. This paper is fire proof and will prevent the moist air from coming in contact with the cool surfaces. He will find that the ventilators cannot be depended upon entirely to prevent the condensation, as they would let all the heat escape. I have used this method where the roof had only 3 inches fall to the foot and the whole structure was made of iron, rafters and all. Asbestos paper is superior to the ground cork which the United States Government uses for a similar purpose. I have tried both, applying the cork to the surface, which had been previously coated with a good white lead paint. The fine cork is thrown against the paint while it is wet, and as the paint dries the cork adheres. This method is, I think, not as good as the asbestos paper with an air space would be in the present case.

A Ventilating System in Connection with a Furnace.

From Anxious Inquirer.—I notice in *The Metal Worker* of December 18 the article entitled "A Ventilating System in Connection with a Furnace," and would like some information as to the following seeming inconsistencies: The smoke pipe is 12 inches in diameter and has an area of about 113 square inches. The ventilating pipes are combined and attached to the smoke pipe by one 14-inch round pipe, which has an area of 154 inches, or about one-third more area than that of the smoke pipe. It is evident that all the air passing through the ventilating pipes must escape through the smoke pipe. The invention is patented and, therefore, all rights being secured to the inventor of this most interesting system, I would esteem it a special favor if he would state in what way he secures an exhaust in the ventilating pipe and what the effect is upon the draft of the furnace when he uses for ventilation the whole and one-third more than the entire smoke pipe area.

Note.—We present the letter of this correspondent and call his attention to the fact that in the opening part of the article it is stated that the system has been in operation during one winter and that it is noticed that the long pipes leading to distant rooms have a good flow of air. It is possible that the difference in the areas of the two pipes may be explained by assuming that the air in the ventilating system being cool travels very sluggishly and only a comparatively small number of cubic feet of air pass through the large pipe in a given time, while on account of the heat in the smoke pipe a much greater velocity is attained and by this means the apparent inconsistency is practically nullified. We shall be glad to have the inventor make any further explanation that he may consider necessary.

From C. P. E. Chicago.—I like the heating system shown in *The Metal Worker* of December 18 very much, having examined it with great care and interest. Some time later, however, I would like to hear from some one who has talked with the occupant of the house and learned his experience in running the furnace. One of the points that I would like to have commented on is, Does the furnace heat well when the ventilating system exhausts into the smoke pipe? I have great doubts as to this, as I once had a somewhat similar system in my own house.

Note.—To this correspondent we can only say that the system has passed through one season's practical test with satisfaction to all concerned.

The Advantages of an Intercepting Trap.

From X.—I would like to know what benefit the running trap furnishes when placed on a horizontal line of soil pipe, as required in many specifications, and if it is necessary in a first-class job.

Note.—This is a question on which many sanitary authorities disagree. Some urge that if a fresh air inlet is provided there is no occasion for the intercepting trap, provided the fixtures in the building are properly trapped and proper measures taken to prevent their being siphoned. This view, however, is different from that which is entertained by the health authorities and the plumbing inspectors in many large cities. Either the front wall or running trap on the horizontal line or intercepting trap, as it is variously called, is required in a majority of cases, although there are exceptions where some cities do not require it.

STOVE TRADE NOTES.

A Review of the Stove Trade.

BY GEORGE W. COPE.

Those who expected to see an enormous stove trade in 1897 were disappointed. Quite an improvement was realized over 1896, and a few manufacturers report a large volume of business, but it must be admitted that results generally were not up to expectations. A conservative estimate based upon wide observation by men of good judgment and long experience puts the gain of the whole country over 1896 at 10 per cent. Probably the year opened with hopes set too high. The country had been favored with excellent crops, political agitation had been settled, national finances were again in good shape, foreign countries were buying heavily of our surplus products, and as far as the future disclosed itself to mortal vision not a disturbing element was to be seen. Why should a country not be prosperous under such conditions? It was assumed that the restoration of confidence in business and financial circles would act upon the country like the removal of a weight from a spring. Suspended operations were to be resumed, new enterprises were to be started up, the idle millions were to be set to work and the bustle of good times was to pervade every section of the country. But the reaction came about very slowly. Instead of a sudden jump to prosperity, the work of rebuilding our depressed activities has proved a matter of gradual growth, which may be spread over a couple of years. Perhaps it is better that this is the case. Too rapid a reaction to good times would have caused all values to climb so high that business would have been disorganized. It is certainly better for all concerned that the march to improvement should be made by easy stages and gradual gains than by a gallop which wrecks all calculations. Looking back over the year, the following details of the course of trade present themselves:

FIRST QUARTER.

Despite the conservatism of manufacturers and merchants in the closing months of 1896, large stocks of stoves were carried over for the following season. Under normal conditions these stocks might not have been deemed excessive, but they were too heavy for such a period of general business depression. January was intensely dull, making a worse record than the corresponding month in 1896, which had been thought bad enough. Very few manufacturers had the temerity to operate their foundries at this time. Some of them started up late in the month, or in February, but more in the hope that their resumption of work might have a moral effect in improving general trade than because of an actual demand for stoves. With the increasing disposition to look to national legislation for relief, the coming of the Fourth of March was anxiously awaited, in the hope that the change of administration might work some miracle, but no improvement was seen even after that important political event. In such specialties as steel and gas ranges, however, business was not quite so poor as in cast coal and wood stoves. In fact, in some important trade centers the demand for steel ranges was reported to have shown a marked gain on preceding years, while the gas range manufacturers were particularly pleased with the results in that branch. Gas companies in a number of cities made more liberal terms for those consuming gas for fuel, thereby stimulating the demand for gas stoves. Manufacturers of gasoline stoves made strenuous efforts to increase their trade, both by lowering the prices of stoves and by almost guaranteeing that the price of gasoline would be lower than in the summer of 1896, but their sales ran little if any above those of the corresponding period of the previous year. During this quarter the coal stove manufacturers and wholesale merchants held several meetings, endeavoring to devise some plan for the improvement of their business, but all such efforts came to naught. Meanwhile prices on iron and steel had been falling, owing to the slack demand during the winter months, and this was regarded as indicating little hope of an early recovery in general trade. Seldom had the iron business of this country been in such a deplorable plight as during these months. But the forces destined to bring about recuperation were actively at work. Short crops abroad were compelling foreign buyers to draw heavily on our stores of grain, and as our exports increased prices advanced, bringing more prosperous times to farmers' homes.

SECOND QUARTER.

An improving tendency was first seen in the Western stove trade, as might have been expected. The better prices realized for wheat were directly to the advantage of the agriculturists of that section, and in April evidences of their improved financial condition began to be seen. In May a notable increase took place in the Western demand for cast ranges and cooking stoves. At this time a better feeling also made itself manifest in other branches of trade. Factories which had long been idle resumed operations, those running employed more hands, and prospects therefore grew brighter for the stove trade in towns and cities. June saw the Western manufacturers fairly busy, booking good orders for fall delivery. The spirit of caution, however, dominated the buyers, who placed their orders for shipment at dates somewhat later than usual. The demand for immediate delivery at this time was not large. Much interest was taken in the crop outlook, as on that, it was evident, would depend the course of the trade for the remainder of the year.

THIRD QUARTER.

July and August were months of good trade, especially in the West and South. Heavy gains were made on the corresponding period of 1896. In fact, it was estimated by unusually well informed members of the trade that up to September 1 a much larger business had been done by Western houses than during the whole of the previous year. Manufacturers were greatly encouraged, and looked forward to a still better business during the fall months. But September proved to be an excessively hot and dry month, breaking the records for heat for that month. Drought conditions made themselves manifest over a large part of the country. Grave apprehensions

prevailed that the fall crops might be seriously injured, which would severely blight the improving business prospects in a number of States. Cool weather and rain were earnestly prayed for, but they failed to come.

LAST QUARTER.

The month of October, emulating September, also broke the record for autumnal warm weather. The drought continued, but was much more severe in Wisconsin, Kentucky, Tennessee and Southern Illinois and Indiana than in other States suffering from scanty precipitation. Frost, however, was exceptionally tardy in making its appearance, so that all late crops matured, and some benefit was thus realized from the mildness of the weather. Yellow fever broke out about this time in Mississippi, spreading into Louisiana, and causing rigid quarantine regulations to be established in Arkansas and Texas, which interfered decidedly with the Southwestern trade. Colder weather in November brought an improved demand, which developed into a semblance of briskness as the month grew older. Shipments were hurried, showing that stocks were very small in dealers' hands. The demand continued good well into December, diminishing and increasing with alternations of warm and cold weather.

Special Features of the Year's Trade.

Among the especially noteworthy features of the year's trade may be enumerated the following:

1. The first four months of the year are entitled to the bad distinction of having been the worst period the stove trade has ever known.

2. Our manufacturers, as usual, exhibited remarkable enterprise in bringing out new patterns and in a few instances entirely new lines of stoves.

3. The improvement in trade was primarily due to short crops abroad and heavy crops in this country, which restored purchasing power to farmers. Without this great leverage the most enterprising manufacturers might have been able to hold their own at the expense of their less able competitors, but there would have been no general improvement.

4. Few stove manufacturers are now dependent on cast stoves and ranges. They have added to their output steel ranges, or warm air furnaces, steam heating boilers, hot water heaters, gas stoves, gasoline stoves, oil stoves or even the scorned tamale. The tendency to cut loose from old methods was never more marked than it has been in the past year.

5. It would be interesting to know how the aggregate value of stoves sold in 1897 would compare with that of previous years. An important percentage of stove manufacturers has been forced out of the business in the past three or four years, and at the same time cheaper and cheaper goods have been substituted for the ancient standards in the trade, so that despite the improved demand of 1897 it is believed that the aggregate value of the stoves sold would fall below that of even 1893 or 1894.

6. The year was almost wholly free from labor troubles in the stove foundries, the only occurrences of this character having taken place in some of the Southern stove works outside of the Defense Association.

7. It was one of the very few years in which no complaint was heard of the cancellation of orders.

Prospects for the New Year.

It is easy to talk hopefully when cheerfulness is the predominant feeling in all trade circles. Every business man is looking forward to 1898 as a year which promises fat things. On all sides preparations are being made for expansion. Two of our very great interests, agriculture and railroads, are in an exceedingly prosperous condition. Farmers are paying off mortgages, redeeming lands sold for defaulted interest and taxes and taking possession of abandoned properties, while railroad companies are reporting larger earnings than ever before in their history. Innumerable related interests are thriving on the prosperity of these two, and it is difficult to see how the coming year can bring bad trade in any branch. The fact that the masses of the people now have fuller employment should cause a great increase the coming spring in the demand for ranges and other cooking goods. But perhaps the most desirable feature of improving times is the expected revival of the demand for the better classes of stoves and ranges. A heavy demand for high priced goods would bring back the halcyon days of the leaders in the trade.

Trade Meetings.

The most important stove trade meeting of the year was the Twenty-sixth Annual Convention of the National Association of Stove Manufacturers, which was held in Detroit, Mich., on May 12 and 13. The attendance was large, and much interest was taken in the proceedings. It was decided to establish a co-operative stove repair sales house in Chicago, and a committee was appointed to carry the decision into effect. This, however, has not been done up to the present time, although the practicability of the scheme is generally conceded. The election of officers resulted as follows:

President, Charles S. Prizer of Orr, Painter & Co., Reading, Pa.

First Vice President, Francis Kernan of Syracuse Stove Works, Syracuse, N. Y.

Second Vice-President, N. H. Burt of Great Western Stove Company, Leavenworth, Kan.

Secretary, T. J. Hogan, Chicago.

Treasurer, W. F. Stevenson of Thomas, Roberts, Stevenson Company, Philadelphia, Pa.

Central Executive Committee: The officers of the association, together with Franklin L. Sheppard, Philadelphia; R. G. Rennolds, Richmond, Va.; Jasper Van Wormer, Albany; W. E. Walker, Taunton, Mass., and Fred. W. Gardner, Chicago.

The association decided to hold its convention in 1898 in Philadelphia. A special feature of the Detroit convention was the round of entertainments provided by the Detroit manufacturers. They made the occasion a memorable one in the annals of the association.

THE DEFENSE ASSOCIATION.

The Stove Founders' National Defense Association met in Detroit during the same week, but held only a brief session. No labor troubles either had occurred or were pending, so that the proceedings were of a routine character, consisting merely of the presentation of the officers' reports and the annual election, which resulted as follows:

President, Chauncey H. Castle, Quincy, Ill.

Vice-President, Henry Cribben, Chicago.

Treasurer, Abram C. Mott, Philadelphia.

Secretary, Thomas J. Hogan, Chicago.

Executive Committee: The officers just named, *ex-officio*, and Grange Sard, Albany, N. Y.; C. S. Prizer, Reading, Pa.; Jeremiah Dwyer, Detroit, Mich.; W. W. Baldwin, Cleveland, Ohio; W. T. Bradberry, Allegheny, Pa.

STEEL RANGE MAKERS.

An unsuccessful attempt was made at Detroit to form a steel range association. The manufacturers of steel ranges had been invited to be present and co operate with those stove manufacturers who also make steel ranges in effecting an organization, but the prominent exclusive steel range makers were not represented. The others therefore concluded to defer the project for the time being, although all of them were convinced that the condition of the business would be greatly benefited by an association if it could be made comprehensive. The year passed without any further steps being taken in this direction.

FURNACE MANUFACTURERS.

The failure of the effort in 1896 to form a national association of furnace manufacturers did not wholly discour-

age attempts at organization in this branch of trade. A practical association was organized by Eastern manufacturers named the Furnace Manufacturers' Association, which held frequent meetings in New York City during 1897. Nearly every furnace manufacturer in the East has enrolled his name on the list of members. The meetings were not only interesting but were productive of valuable results to the members. Among other important matters accomplished a standard uniform contract blank was adopted for the use of furnace dealers in contracting with customers, which has met with universal favor.

The Western furnace manufacturers held a meeting April 7 in Chicago and formed the Western Furnace Manufacturers' Association, with the following officers :

President, C. A. Sercomb.

Vice-President, H. N. Reynolds.

Secretary and Treasurer, A. W. Glessner.

Executive Committee, H. H. Kennedy, A. P. Richardson and E. P. Mott

Several meetings were held subsequently and important action was taken relative to trade abuses.

NEW ENGLAND STOVE MAKERS.

The New England Stove Manufacturers' Association held their fifth annual meeting in Boston on May 27 and elected the following list of officers :

President, R. E. Warner of White, Warner & Co.

Vice-President, P. W. Elliott of the Highland Foundry Company.

Secretary and Treasurer, H. A. Tinkham of White, Warner & Co.

Executive Committee, W. A. Spicer of the Spicer Stove Company, W. E. Walker of the Weir Stove Company and G. L. Walker of the Century Stove Company.

P. W. Elliott was presented by the members of the association with a silver and gold loving cup in recognition of his services as secretary and treasurer since the organization of the association in 1892.

VAPOR STOVE MAKERS.

The Vapor Stove Manufacturers' Association held their annual meeting at Cleveland, Ohio, August 3, adjourning to Little Mountain, a local summer resort, where they completed their business. The following officers were elected :

President, Isaac Kinsey of the Dayton Mfg. Company.

Vice-President, D. E. Dangler of the Dangler Stove & Mfg. Company.

Commissioner, F. L. Alcott of the Standard Lighting Company.

The United Vapor Stove Manufacturers' Association, makers of evaporating stoves, held their meeting on the next day and elected the following officers :

President, Paul Schneider of the Schneider & Trenkamp Company.

Vice President, O. P. Moon of the National Vapor Stove & Mfg. Company.

Commissioner, F. L. Alcott.

The members of these associations met again at Cleveland September 23 and organized the Union Vapor Stove Company, into which they merged all their patents on gasoline stoves, electing Paul Schneider president, E. C. Baxter vice-president and F. L. Alcott secretary and treasurer.

EQUITY PROTECTIVE ASSOCIATION.

The annual meeting of the Equity Protective Stove Association of the United States was held at Troy, N. Y., November 4. This is an organization which has proved of much value to the members in the settlement of patent claims and litigation. Charles A. McLeod was elected president and E. T. Anthony secretary and treasurer.

Quite a number of local meetings of stove manufacturers were held at various points during the year, some of them being of considerable importance. Their proceedings were private, but so far as could be learned the results accomplished had but little effect on the trade or on prices.

Improvements in Plant.

The march of enterprise among stove manufacturers steadily continues, whether times are dull or brisk. Preparations were made during the year in numerous instances to handle a larger business. It is gratifying to note these evidences of thrift. While there may have been many improvements made of which we have no record, those which have come under our observation are as follows, arranged in chronological order :

John E. Gaitley of the Troy Nickel Works, Troy, N. Y., purchased the plant formerly operated by the Perry Stove Company, at Albany, for the purpose of securing increased facilities for the manufacture of Alaska stove trimmings.

William Highton & Sons, Nashua, N. H., manufacturers of hot air registers, ventilators, &c., added considerably to the capacity of their works.

Weir Stove Company, Taunton, Mass., built another warehouse, 50 x 75 feet, two stories high.

Southard, Robertson & Co., Peck slip and Water street, New York, added another story to their warehouse and put in an electric elevator.

The Charter Oak Stove & Range Company, St. Louis, added a new building, 84 x 112 feet, for offices and sample room.

The Crow Stove Polish Company, Milwaukee, Wis, erected a brick factory, 26 x 80 feet, two stories high.

Floyd, Wells & Co., Royersford, Pa., added a five-story brick building, 67 x 98 feet, to be used for offices, shipping department, nickeling and polishing departments, tin shop and additional mounting floor and storage.

A. Weiskittel & Son., Baltimore, Md., purchased 25 acres of land near their factory for the erection of enameling works, iron foundry, &c.

Geo. M. Clark & Co., Chicago, removed their factory to Harvey, Ill., securing very much larger quarters and improved shipping facilities, greatly increasing their capacity for the transaction of business.

The S. M. Howes Company, Boston, made extensive improvements in their arrangements for handling stove repairs and stove dealers' supplies.

Robert Robinson & Sons and the Robinson Furnace Company removed to 107 and 109 Lake street, Chicago, securing an enlarged space greatly needed for the accommodation of their growing business.

The Front Rank Steel Furnace Company, St. Louis, Mo., removed to a new factory on the northwest corner of Twenty-third street and Lucas avenue, affording much more space for their rapidly increasing trade. The new factory is 100 x 125 feet, six stories high, with a basement.

The Great Western Stove Works, Leavenworth, Kan., added a nickel plating plant to their works. Their nickeling had previously been done outside.

The Richmond Stove Company, Norwich, Conn., purchased adjoining ground and buildings sufficient to give them a frontage of 1000 feet on the Thames River and thus enable them to greatly increase their facilities.

The Buckwalter Stove Company, Royersford, Pa., erected a two-story building, solely for office purposes.

The Walker & Pratt Mfg. Company built a new foundry at Mount Auburn, Mass., which they will shortly move into, the structure covering about 3 acres of ground.

The Indianapolis Stove Company, Indianapolis, Ind., purchased the Indianapolis Cabinet Company's plant on Malott avenue, covering 5 acres, and remodeled it for the manufacture of stoves, thus greatly increasing their facilities. The old plant was kept in constant operation until the new one was ready for use.

The Ringen Stove Company, St. Louis, enlarged their steel range factory, making the output of Quick Meal steel ranges 35 daily.

The Olive Stove Works Company, Rochester, Pa.,

erected a brick addition to their plant, 48 feet long and two stories high, to accommodate their growing business.

S. B. Sexton & Son, Baltimore, Md., opened a new retail store at 7 Gay street, the building containing five floors and a basement and communicating with three upper floors of an adjoining building, also occupied by the firm. The upper floors are used for warehouse purposes, supplementing the firm's other warehouses.

The Estate of P. D. Beckwith, Dowagiac, Mich., installed a new steam plant in the Round Oak Stove Works, comprising an Allis engine and Babcock & Wilcox boilers. The engine is a heavy duty cross compound condensing engine of 500 horse-power and affords a large addition to the power of the former plant, rendered necessary by the increasing business.

The Detroit Furnace & Heater Company, Detroit, Mich., started the machinery in their new plant December 1. The new plant is about three times as large as the old one, which was burned September 25.

The California Stove & Iron Works, Oakland, Cal., have found it necessary to enlarge their factory to keep pace with the growth of their business. They have a flourishing trade with the Hawaiian Islands.

New Enterprises.

Seldom have so many projects been launched in connection with the stove trade as last year.

The United States Vapor Stove Company, Detroit, Mich., filed articles of association, with a capital stock of $10,000, to manufacture and sell vapor burners, stoves and stove supplies.

The Pilgrim Iron Foundry Company, Plymouth, Mass., have made a departure from the usual practices of the trade. They make one line of ranges only. By this method they are able to produce a range for less money than could otherwise be done.

The Gurney Stove & Range Company were incorporated at Rome, N. Y., with a capital stock of $20,000, to manufacture stoves, ranges, heaters and other metal specialties, including the Gurney oil stove.

The Terre Haute Stove & Furnace Company, Terre Haute, Ind., were incorporated to conduct a general stove business.

The Ideal Foundry Company, capital stock $10,000, were incorporated at Piqua, Ohio, to manufacture stoves and conduct a general foundry business.

The Thomas J. Dowling Company, capital stock $20,000, were incorporated at Albany, N. Y., to operate the plant formerly owned by the Albany Stove Company.

The South Pittsburgh Stove & Foundry Company, South Pittsburgh, Tenn., took out a charter of incorporation.

The Summit Foundry Company were incorporated at Geneva, N. Y., to manufacture stoves. The leading stockholders were formerly with the Phillips & Clark Stove Company.

The Perry Stove Repair & Mfg. Company, Albany, N. Y., were incorporated to manufacture repairs from the original patterns for stoves made by Perry & Co. and the Perry Stove Company.

The Southern Ohio Stove Company were incorporated at Waverly, Ohio.

The Hillsdale Furnace & Foundry Company, capital stock $50,000, were incorporated at Hillsdale, Mich., to manufacture warm air and combination furnaces.

The Walterstroff-Haskell Range & Furnace Company, capital stock $10,000, were incorporated at Minneapolis, Minn.

The Shields Foundry Company, Mansfield, Mass., were incorporated to manufacture stoves and ranges

The National Stove Company, capital stock $10,000, were incorporated at San Francisco, Cal.

The Worthington National Grate Company, capital stock $50,000, were incorporated at Baltimore, Md., to manufacture furnace and other grates.

The Cedar Rapids Stove Company, Cedar Rapids, Iowa, were incorporated to manufacture a patent air tight Todd stove and other heating apparatus.

The Palace Stove Company, Richmond, Va., were incorporated to manufacture a line of triple heating air tight stoves embodying novel features.

The Ideal Stove & Foundry Company, Daleville, Ind., poured the first heat in their new foundry September 1. The town is located in the gas belt, and the company secured not only free fuel, but a free site and a brick building 70 x 160 feet, two stories high. They purchased from the Girard Stove & Foundry Company, Youngstown, Ohio, the patterns of the Adelbert line of stoves and ranges. Notwithstanding the lateness of the season the company did a good business.

The Smokeless Fuel Saving Stove Company, capital stock $100,000, were incorporated in New York City.

The Albany Foundry Company, capital stock $50,000, will be organized to manufacture stoves and castings in the old Perry Stove Works, at Albany, N. Y.

The Southern Stove, Hollow Ware & Foundry Company, Chattanooga, Tenn., began manufacturing operations about December 1. This is a notable enterprise, the company being composed wholly of negroes, all of whom are practical molders. C. H. Fearn is president, Will Martin general manager and D. B. Gordon secretary. They make stoves and hollow ware and at present sell their goods to Chattanooga merchants. They have made a successful start in business and feel greatly encouraged. They are pouring three heats per week and melt about a ton of iron at each heat.

Changes and Reorganizations.

Quite a number of changes were brought to our attention as the year passed, but the failures were few and comparatively unimportant.

The old plant of the Mason & Davis Company, at Grand Crossing, Chicago, was taken over by a new corporation styled the M. & D. Range Company, having a capital stock of $75,000.

The Metric Metal Company, Erie, Pa., sold the patents, patterns, stock, &c., of the Classic gas ranges and heaters to the Griswold Mfg. Company of the same city, having New York warerooms at 294 Pearl street.

The Cook & Van Evera Company, capital stock $25,000, succeeded D. S. Cook at 173 and 175 Lake street, Chicago. The business was established in 1868 by D. S. Cook, and he still retains his connection with it. The company market their stoves and ranges under the Jersey trademark.

The Peekskill Stove Works purchased the patterns and business of James G. Lyon, 248 Water street, New York.

J. W. Paxson & Co., manufacturers of foundry facings and supplies, Pier 45, North Delaware avenue, Philadelphia, Pa., became incorporated as the J. W. Paxson Company, with a capital stock of $450,000.

White, Warner & Co., Taunton, Mass., became incorporated as the White, Warner Company, continuing the manufacture of Household stoves, ranges and furnaces.

The Excelsior Stove & Repair Mfg. Company, capital stock of $21,000, succeeded to the manufacture of the Imperial sheet iron wood heating stove and the Up and Down draft radiator, formerly made by A. Ohnemus & Brother, Quincy, Ill.

The Colonial Stove Company succeeded to the firm of Wm. L. Brownback & Co., 70 and 72 North Second street, Philadelphia, Mr. Brownback retiring and Horatio L. Yacum continuing as the liquidating partner under the name above designated.

The patterns, flasks and other personal property of the Superior Stove Company, Superior, Wis., were sold under

foreclosure proceedings to Isaac Everitt of Pittston, Pa., who also controls the real estate.

The Sheffield Stove Works, Sheffield, Ala., changed their name to Sheffield Stove Foundry.

Bridgeford & Co. were incorporated at Louisville, Ky., with $75,000 capital stock and privilege of increasing to $150,000.

Fires.

The Northwestern Stove Repair Company, 225 to 235 West Twelfth street, Chicago, suffered a heavy loss in the destruction of a warehouse, January 24, but saved all their patterns. The damaged portions of their plant have since been rebuilt in the most substantial manner.

The Eagle Stove Company, Fall River, Mass., were put to some incovenience by a fire in their pattern shop February 11.

The A. J. Lindemann & Hoverson Company, Milwaukee, Wis., were visited by fire May 25, but suffered greater damage from the water used in extinguishing it.

The Hudson Stove Works, Hudson, N. Y., narrowly escaped a serious fire August 4, only a few days' interruption to work being caused.

The Detroit Furnace & Heater Company, Detroit, Mich., lost their foundry by fire September 25.

The worst fire of the year was that of the Bonnet-Nance Stove Company, Quincy, Ill , the greater portion of whose works was destroyed October 27, entailing a loss approximating $100,000. It was the fourth severe loss to which this establishment has been subjected. The plant is being rebuilt.

The Kling Stove Company, Gallipolis, Ohio, suffered from the partial destruction of their molding shop November 5, but soon repaired damages sufficiently to resume work

Generally Interesting.

The Charter Oak Stove & Range Company, St. Louis, Mo., increased their capital stock from $50,000 to $100,000, the additional capital having been found necessary to meet the requirements of expanding trade.

Col. C. B. Boynton of the Boynton Furnace Company, New York, who acted as marshal of the stove and furnace manufacturers in the sound money demonstration in the autumn of 1896, was presented with a memento of the occasion consisting of the silk banner borne in the procession, inclosed in a richly trimmed black walnut case with a plate glass front.

The Gas Exposition held in New York in February brought out the best productions of the gas range manufacturers.

Anti department store agitation was quite a feature of the year. Retail hardware associations were organized in a number of States, designed to combat the growth of such stores as well as catalogue houses.

The great floods in the Ohio Valley in March caused some of the stove foundries in river towns to suspend operations until the water receded from their buildings.

The Sill Stove Works, Rochester, N. Y., established a distributing agency at Boston, Mass., to serve their growing New England trade.

The Charter Oak Stove & Range Company, St. Louis, captured an order for supplying the United States Government with about 1600 stoves, of which 1300 were cook stoves.

Buck's Stove & Range Company of St. Louis again awakened the trade by a huge advertisement in *The Metal Worker*, filling 16 pages in the issue for July 17. They followed this up in later issues by the staggering announcement that they would ship to Southwestern points on orders four train loads of 20 cars each. The trains were duly dispatched, but the number of cars was considerably exceeded. On August 26 the fourth annual banquet was given by the company to the St. Louis stove merchants, of whom nearly 150 were present. They received a silver medal for the most complete display of steel ranges at the Tennessee Centennial Exposition.

S. S. Jewett & Co. removed their Chicago branch to 1142-1158 West Sixteenth street, securing a most convenient location on one of the great railroad arteries of the city.

Frank A. Klaine, proprietor of the Good Will Foundry, Cincinnati, was the recipient in July of valuable tokens of esteem from his employees in commemoration of the twenty-fifth anniversary of his connection with the establishment. These consisted of a 30-drawer letter file cabinet, an easy chair and other useful articles.

The foundry department of the Tennessee main prison was leased to Duncan & Co., who are manufacturing stoves and hollow ware.

Shipments of Quick Meal Blue Flame oil stoves were made to Ireland and to the West Indies by John P. Lea, 239 Water street, New York, manager for Charles Noble & Co., Philadelphia.

The Michigan Stove Company's reputation for enterprise needs no outside assistance in the way of praise. A report of what they do, when stated in ungarnished words, extorts a feeling of admiration for their leadership. This year they brought out entirely new patterns of cooking goods, coming nearer to making a complete revolution in their line than has ever before been attempted in the history of the business. This would be a feat if it were done in a time of very good business and large profits, but it was undertaken in one of the dullest periods ever known in the stove trade, when everybody was economizing because it was impossible to perceive any indications of improving business. When the line was ready for the market it was perfectly in keeping with such an achievement to announce the fact in a mammoth advertisement covering 24 pages of *The Metal Worker*, which was done in the issue of August 14. This breaks the record for the largest single advertisement ever inserted in this journal. A silver medal, the highest award for any stove exhibit, was voted to them for their exhibit of Garland stoves and ranges at the Tennessee Centennial Exposition.

The Excelsior Steel Furnace Company, Chicago, manufacturers of furnace fittings, received more carload orders for their goods than in any previous year of the company's history.

The John B. Morris Foundry Company, Cincinnati, manufacturers of stove repairs, made the year a memorable one in their history by getting out a remarkably complete set of patterns for water backs, covering so many different makes of ranges that they are practically ready to meet any demand.

The Front Rank Steel Furnace Company, St. Louis, shipped two furnaces to Corea, one going via New York and the other via San Francisco, thus making the two furnaces encircle the globe in reaching their destination.

Rathbone, Sard & Co., Albany, N. Y., were obliged by the rush of orders the past year to open their shop No. 2, which had not been used since 1893.

The Detroit Stove Works have had an increased demand for their goods in foreign markets. In one month they made shipments to the Hawaiian Islands, South Africa, Belgium, Germany and Great Britain, and had an inquiry for gas stoves from Milatore, India.

James S. Lithgow, the veteran stove manufacturer of Louisville, Ky., celebrated his eighty-sixth birthday on November 29. Notwithstanding his great age, Mr. Lithgow is still actively engaged in business.

The exports of stoves from this country in the fiscal year ended June 30, 1897, showed only a slight gain on the preceding year. The value was $325,625, against $320,659 in the fiscal year 1896. The reports for the first nine months of this year, however, show a good increase over the same period of last year, the exports being $255,547, against $214,171 last year. Reports for later months have not yet been issued.

Technical Progress.

The Michigan Stove Company for the second time judicially established their right to what is known in the trade as the reflector top stove. The genuine reflector top has an inturned mica filled section having a reflector placed above it. The company brought out this year an entirely new idea in the Front Flue Oak Garland, which has proved a highly satisfactory stove. Letters from the trade state that this is the only stove thus far tried which is a full base heater and can be used for any kind of fuel.

C. W. Aldrich, Minneapolis, Minn., representing the Mississippi Valley Stove Company, obtained a patent on a heating stove designed to secure perfect combustion, economize fuel and thoroughly utilize the heat generated by the fire.

The Ringen Stove Company, St. Louis, after long experiments have succeeded in perfecting a process of enameling the fronts of their Quick Meal steel ranges. In this way a smoother, blacker and glossier front is obtained than by painting, and it will also stand much greater heat.

More stove manufacturers added steel ranges to their line of goods the past year, and the craze for sheet iron air tights or "tamales" caused considerable exploiting in that field. The regular stove manufacturers, however, departed considerably from the simple construction adopted by the pioneers in the air tight trade, introducing features adding to the durability of the stove.

Deaths.

The roll of departed members of the trade has been greatly lengthened in the past year. Many prominent names have been added by the dread messenger. Those who have come under our notice are as follows:

JANUARY.

James B. Rue, representative in Southern Michigan of the Peninsular Stove Company, Detroit, Mich. He had been connected with the company for ten years.

Charles Truesdale, Cincinnati, Ohio, for 40 years a member of the firm of William Resor & Co. Died January 14, aged 70 years.

FEBRUARY.

George E. Hopkin of Philadelphia, for several years secretary of the Abram Cox Stove Company, and an inventor of improvements in stove and furnace constr uction. Died February 7, aged 50 years.

William L. McDowell, president of the Leibrandt & McDowell Stove Company, Philadelphia. Died February 24, aged 73 years.

Alexander Morrison, for 40 years connected with Morrison & Son and Morrison & Tibbitts, Troy, N. Y. Died February 25.

Sherman S. Jewett, of S. S. Jewett & Co., Buffalo, N. Y. Died February 28, aged 80 years.

MARCH.

J. P. Lindemann of J. P. Lindemann & Sons, Milwaukee. Wis. Died March 17, aged 74 years.

Charles Eddy of Charles Eddy & Co., Troy, N. Y. Died March 19, aged 81 years.

APRIL.

Edwin S. Barbour, president of the Detroit Stove Works, Detroit, Mich. Died April 3, aged 64 years.

Jacob Weaver, for over 50 years member of the firm of Weaver & Volkmar, Philadelphia. Died April 14, aged 90 years.

Isaac De Haven, chairman of De Haven & Co., Limited, Pittsburgh, Pa. Died April 15, aged 59 years.

MAY.

Rolla A. Ullman, foreman of the Chicago Stove Works, Chicago. Died May 15, aged 40 years.

JUNE.

Thomas Holt, stove merchant, Philadelphia. Died June 7, aged 52 years.

JULY.

Washington Harris, an old time stove manufacturer, Philadelphia. Died July 10, aged 84 years.

George W. Demond, Plattsburg, N. Y. Died July 11, aged 66 years.

William Buck, Brantford, Ontario, Canada. Died July 15, aged 69 years.

George E. Priest, Boston, Mass. Died July 23.

James H. Van Alen, Peekskill, N. Y. Died July 25.

AUGUST.

Erastus Geer, Watervliet, N. Y. Died August 5, aged 73 years.

SEPTEMBER.

Francis M. Hunter, Spring City, Pa. Died September 5, aged 50 years.

H. H. Culver, St. Louis, Mo. Died September 26, aged 57 years.

NOVEMBER.

Wm. L. Bridgeford, Louisville, Ky. Died November 3, aged 50 years.

John Magee of the Magee Furnace Company, Chelsea, Mass. Died November 5, aged 76 years.

Frank A. Goetz, salesman for the Bridge & Beach Mfg. Company, St. Louis. Died November 20.

Frank M. Gies, director in the Co-operative Stove Company, Black Rock, Buffalo, N. Y. Died November 22.

Jonas Snyder, treasurer of Thomas, Roberts, Stevenson Company, Philadelphia. Died November 23.

Cornelius C. Lent, president of the Peekskill Stove Works, Peekskill, N. Y. Died November 26, aged 71 years.

DECEMBER.

John M. Graff of Graff & Co., New York. Died December 4, aged 62 years.

Solomon S. Detweiler, president of the Keeley Stove Company, Columbia, Pa. Died December 5, aged 64 years.

Geo. W. Eddy, at one time a prominent stove manufacturer of Troy, N. Y. Died December 5, aged 87 years.

The Furnace Trade.

The sharp competition in the heating field has had the effect of increasing the sales of all kinds of furnaces. More of the better class of goods have been used, owing to the disposition to reduce the cost of the more expensive buildings, consequently high grade furnaces and the best class of hot air systems have been used in place of more costly methods of heating. On the other hand, the disposition of those who erect cheap buildings has been to provide all the modern conveniences, including a heating system, and this has increased the sale of the lower grades of furnaces. Those who have made the higher grade of goods have been more successful in maintaining their prices, while the effort to increase the output of the cheaper class of goods has led to their sale at lower prices than ever before.

A new feature in the furnace field is the growing interest in the use of ventilating systems in connection with furnaces. More satisfactory heating in connection with them is claimed, owing to the fact that the flow of air to rooms that would otherwise be difficult to heat has been assisted by the ventilating system, which exhausts the air from them. The use of fans in connection with hot air furnaces is no longer a novelty, a large number of such heating plants having been installed in buildings in various sections of the country during the past year. The success of those in use has largely contributed to the extension of this method of furnace heating.

Opinions of the Trade.

The Cleveland Co-operative Stove Company of Cleveland, Ohio, in referring to the condition of business during the year just brought to a close say : There are many circumstances which work against the cast iron stove business, such as the almost universal use of furnaces in houses of a class which a few years ago we relied upon to be heated with stoves ; also the constantly increasing use of gasoline for cooking purposes, and oil, gasoline and gas for heating purposes, together with the increased output of steel ranges, the cost of producing which becomes materially less each season on account of the decline in the cost of material and the class of labor thereon employed, while the cost of cast iron stoves remains almost stationary. The margin of profit, as compared with last season, has not noticeably changed, but each year the tendency is rather toward a decreased margin. Collections compare favorably and perhaps are slightly better than last season, but not as much more favorable as the changed condition of business and money would lead us to expect. We are in hopes that there will be an improvement in the volume of business for the coming year —in fact, expect that such will be the case—but do not think there will be any noticeable advance in the selling price of commodities.

The Minnesota Stove Company, located at Shakopee, Minn., express the following views : We believe the volume of stove business in the Northwest has shown considerable improvement over last year, but the trade has evidently been spotted and better in some localities than in others. We find the sale of our high priced goods equally as good, if not better than last year, but are satisfied there have been large sales of cheaper goods—namely, air tights, &c. The demand for steel ranges and cooking stoves has been quite large, and we see no reason why it will not continue, although we are not looking for any phenomenal business the coming year, as we consider the volume in 1898 will largely depend on the crops which are yet to be grown, and therefore cannot be definitely calculated. Neither do we believe that prices will be any higher. In fact, we look for lower prices if there is any change at all. On the whole, we do not consider the outlook discouraging and intend to add some new goods to our line.

Charles C. Heath & Co. of Baltimore, Md., in discussing the situation, write as follows : The demand for low priced stoves prevails in our territory south of Maryland, but north of here they demand a better class of goods. There has been no relative change in the margin of profits as compared with last year. Collections are undoubtedly better. We anticipate a good trade the coming year, but can see nothing to lead to a higher basis of price or profit. We think that the tendency is to contract the limit of time allowed on credits, which is undoubtedly necessary, owing to the margin of profit being reduced over former years.

The Rutland Fire Clay Company of Rutland, Vt., who are in a position to feel the pulse of the stove industry, say : Our travelers visit retail stove dealers in 36 of the States, and we have found that business has been gaining, particularly during the latter half of the year, and as compared with 1896 this year's business will show quite a good increase. Collections have been remarkably good the last months of the year, and our travelers report that dealers generally are much encouraged in regard to the prospects for the coming year, and that almost without exception they say they are doing more business than for a long time.

The Michigan Stove Company of Detroit, Mich., among other things, say : The demand since 1892 has not improved for stoves of high grade. This we attribute to the conditions through which we have passed. The mechanic and those who purchase stoves, as a class, we all know, have not been fully employed, consequently they have not earned the same amount of money that they would have earned had they been employed all the time. Economy had therefore to be practiced not only in general lines, but in the stove line as well. There is no question but that the margin of profit is less, but so far as collections are concerned they have been very good. We cannot but conclude that there is a better prospect ahead, and believe, in volume, the trade will be increased. There is not, however, much encouragement as to prices reaching a higher level on some grades of goods.

A prominent stove manufacturer in the New England States, whose trade covers a wide territory, after referring to the unsatisfactory volume of business during the year just closed writes as follows : The tendency has been to purchase low priced goods. There has been some cutting of prices, but, generally speaking, those obtained would have been profitable, providing there had been sufficient business for running the plants fully. The loss of the parlor stove trade has been a serious blow to New England foundries. Of late years oil, gas and gasoline stoves, in addition to the increasing use of furnaces for small houses as well as large, seem to have taken the place of the parlor stove, so that the trade in the latter has shrunk to small proportions. As to collections, they have been slow enough, but that is a thing we get accustomed to in the stove trade, even in good years of business. We do not look for a great increase in volume of trade the coming year. If history repeats itself, it will take another year or two yet to recover from the panic of 1893. Probably the poorest business year the stove foundries of New England experienced after the panic of 1873 was in the year 1878, whereas 1879 was a profitable year. As regards an increase in prices the ensuing year, we see nothing to warrant such an expectation.

Schwab & Sercomb, manufacturers of the Gilt Edge warm air and combination heaters, Milwaukee, Wis., outline the situation as follows : The demand for goods of a high order has really not improved to any extent, but the tendency is to purchase low priced goods. This is greatly against the interests of the manufacturer in the line of heating devices. There has been no alteration in the margin of profit, and we find collections very slow—in fact, a little behind those of last year, we think. The prospects for the future look very assuring. Prices in heating devices will not reach a higher level, but we are of the opinion that the manufacturer will not give such extended credit, turning his money more quickly, which will give more profit. We have in the heating department of our works had a most successful year, having sold 40 per cent. more goods than the year prior. In iron interests we feel that there will be a hardening of prices, not only in iron, but in all material connected with the manufacture of iron. We do not look for any great advance, but should the producers of pig iron see fit to boom their product it would be quite a calamity.

The Baxter Stove Company of Mansfield, Ohio, say : We have sold more of the better grade of stoves and ranges this fall than we did last, the increase amounting perhaps to 20 per cent. There has been no material difference in the margin of profit over the last three years, prices remaining low. We believe the prospects for business next year are much better than they have been for the last three years, but we do not expect better prices. There is certainly a better feeling among dealers. They are paying their bills more promptly and the fall trade has been fully up to our expectations.

The Standard Lighting Company of Cleveland, Ohio, outline the situation as regards oil, gas and vapor stoves as follows : The list prices and discounts on vapor stoves remain the same as last year, notwithstanding the fact that there has been a considerable advance in some of the materials used in their manufacture Our collections have been very satisfactory all through the year, and we think they are somewhat better than they were a year ago. Our fiscal year closed August 1, and up to date our trade is more than double that of last year The outlook for the coming year is very prosperous, and we would not be at all surprised if we were enabled to double our sales of last year. There seems to be a larger demand for our line of goods, both gasoline, oil and gas stoves, for the reason that the stocks in the hands of the dealers are depleted on account of their small purchases during the past year.

The Atlanta Stove Works of Atlanta, Ga., write as follows : During July, August and September of this year trade was all that we could ask for and at fairly remunerative margins of profits. The breaking out of yellow fever in Louisiana, Mississippi and Alabama prevailing in September, October and November practically destroyed the business of those States for this season. The prolonged warm weather has also retarded sales, and the low price to which cotton has fallen has practically stagnated business. The low price of cotton always brings a demand for low priced stoves, in which there is no profit, and this tendency to produce low priced goods will continue at least until there is an advance in the price of cotton. Collections are also flat because of the above mentioned conditions. Viewing these facts as they now exist, we see nothing of encouragement, at least for the beginning of the new year. We have been forced to curtail forces both on the road and in the factory, and we believe that another crop must be raised before there can possibly be much improvement. We are naturally optimistic. The outlook as we see it causes us to take a position about midway between optimism and pessimism.

W. H. Barnard & Co., manufacturers' agents, Norfolk, Va., in reviewing the business for the past year refer to the noticeable demand for other than high priced stoves. They say : In this connection and in others, as we find from inquiry, the demand for the sheet iron air tight stoves for wood has not abated; on the contrary, the sale of them has largely increased over previous years. We regard this as a misfortune, because it certainly results in a loss of profit to the stove dealer, who misses the sale of

higher priced cast iron goods and a consequent loss of repairs. We consider that the trade of the stove and hardware dealer has suffered seriously from competition from installment houses and department stores. We think that there should be a national association of retail stove men to look after their interests, as is done by the Master Plumbers' Association, for unless they organize for protection their interests will continue to be encroached upon. We believe that the distress which to a large extent prevails among the retail stove dealers is due to the fact that they have no organization for mutual protection and defense. In our judgment the organization of such an association is imperative. We shall enter a new year very conservatively. We do not anticipate for the coming year business of a much different character from that existing in the last two years. We see no reason to suppose that prices will range higher for the coming year.

The Toledo Stove Company of Toledo, Ohio, referring to the business of the past year state that it has been double that of any other year and with fair prices. They say that as far as collections are concerned, "they have been much better than for any previous year. We consider the conditions for next year to warrant a steady and regular business, but do not think there will be any great flourish; rather it will drift along quietly and agreeably. During the past year we have worked overtime and run to the fullest capacity, and at the time of writing have only lost two heats in working days this year, July 4 and Labor Day."

TRAVELING STOVE SALESMEN FOR 1898.

The Magee Furnace Company of Boston, Mass., have arranged with S. Olin Field to look after their interests in the Western and Middle States; S. E. Newell, Alfred T. Stockbridge and T. R. Andrews will cover the New England States; Lott & Farquharson will represent the company in Chicago, Ill.; Rood & McIntyre in Kansas City, Mo., and Mangrum & Otter in San Francisco, Cal. The heating and ventilating departments for the installation of new work is in charge of Frank E. Woodward and a corps of able assistants. W. C. Higgins, formerly manager of the Richmond Stove Company of Norwich, Conn., will have supervision of the construction and sales departments in the steam and hot water line.

A. T. Nye & Son of Marietta, Ohio, will be represented by A. T. Nye, Jr., who will cover Ohio, Indiana and Illinois, and Ed. Highland, who will visit the trade in Virginia, West Virginia and Kentucky.

Bergstrom Brothers & Co. of Neenah, Wis., have arranged with C. S. Youngs to look after their interests in Wisconsin and Upper Michigan; R. J. Bird in Iowa, Minnesota and South Dakota; F. W. Lucas in Minnesota, South Dakota and North Dakota, and George H. Loy in Iowa and Western Illinois.

The Indiana Stove Works of Evansville, Ind., announce that their traveling salesmen for 1898 will include F. O. Headley, who will visit the trade in Missouri and South Iowa; W. H. Brennecke in Illinois; W. F. Karges in Texas; A. H. Roekler in Arkansas, Tennessee and Southeastern Missouri; E. C. Specht in West Mississippi and Louisiana; A. J. Schulz in North Iowa, Minnesota and Wisconsin; R. F. Corbyn in East Kansas, Nebraska and South Dakota, and J. E. Adkins in Alabama and East Mississippi.

The Kernan Furnace Company of Utica, N. Y., have arranged with the following salesmen to look after their interests in the territory indicated: W. S. Reed and Charles R. Morgan will cover the West; C. H. Fresher the States of Michigan, Ohio and Indiana; New York and the Eastern States will be covered by John A. Breen, while their Eastern branch, as formerly, will be located at 105 Beekman street, New York City.

The Henry N. Clark Company, Boston, Mass., have arranged with the following staff to look after their interests in the territory named: L. M. Barnes will cover Connecticut and Western Massachusetts; J. W. Denny, Maine and New Hampshire; T. W. Burden, Eastern Massachusetts and Vermont; C. W. Wheelock, Boston and vicinity, and A. G. Gillespie will have entire charge of their Bicycle department and travel in the leading places in New England in the interest of the same.

Benjamin F. Goodrich.

Benjamin F. Goodrich, proprietor of the Electric Oil Stove Works, at Homer, Mich., died December 21 of pneumonia. He was 52 years old and was the most prominent citizen of the town, enjoying a wide acquaintance in other parts of the country through his business enterprises. In 1895 Mr. Goodrich was a prominent candidate for the Congressional nomination in the Third District of Michigan. He was president of Homer village for three successive terms. He was a prominent Mason and a member of Marshall Commandery, Knights Templar, which order conducted the funeral services. Mr. Goodrich was born in Saline, Mich., December 20, 1845. He removed to Homer in 1875 and engaged in the hardware business. He then started the manufacture of bathtubs, and about ten years ago he commenced the manufacture of the electric oil stove. This industry grew until, it is claimed, it became the largest factory of its kind in the world. He leaves a widow and two children.

ODD PLATES.

The latest postal card sent out by the Gobeille Pattern Company, Cleveland, Ohio, is a combination advertisement and Christmas greeting, the whole encompassed with a golden atmosphere.

The Monarch Stove & Mfg. Company of Mansfield, Ohio, have established a number of agencies for the sale of their goods during the season of 1898, and we give below a list of those with whom arrangements have already been completed. They will be represented in the Eastern markets by A. L. Canfield, 284 Pearl street, New York City, who has charge of the New York office; by J. C. H. Lynn of Philadelphia, Pa., who has charge of the Philadelphia office, and the Danvile Stove & Mfg. Company of Danville, Pa., who will look after the trade in Central and Western Pennsylvania. The trade in Nebraska will be looked after by the Hall Stove & Range Company of Lincoln, and that in Missouri and Kansas by the Zahner & Battelle Mfg. Company, Kansas City. The State of Minnesota and the Dakotas will be taken care of by G. W. Cahoon, who has charge of the company's branch house at St. Paul, and Western Pennsylvania will be covered by R. E. Edmonds, who will have charge of the branch house at Pittsburgh, where a stock of goods will be carried. Southern Ohio will be covered by R. W. Ross & Son, the general State of Ohio by Charles E. Bartenbach, who has been with the company for the past ten years, and the State of Michigan will be covered by C. W. Kroosz, who represented the company in that territory last year.

Where the practice of the Michigan Stove Company will lead them if they keep on sending out more and more valuable souvenirs we cannot tell, but we do know that the trade most heartily appreciate the beautiful and serviceable gifts, for they are more than advertisements, which this company distribute. There comes to us with the compliments of the season the prettiest sort of aluminum match box which has evidently been designed by some one who understands the requirements of the case. The match box is of the proper size, neither too small for the larger sizes of parlor matches nor so long as to be clumsy. The corners are rounded so it will not wear the pocket, and the finish is in every particular most carefully and neatly done, while of course the lightness of the material is a very great advantage. We are not told how generally the Michigan Stove Company are distributing these souvenirs, but we do know that every one of their customers, not to mention others, would be very glad of a sample.

The Metal Worker acknowledges the receipt of an invitation to attend the annual banquet of the North Second Street Stove Dealers, at the Bourse, Philadelphia, December 30, 1897. The success of the affair was assured by the committee in charge, composed of W. G. Withers, H. F. Tyson and W. F. Habicht.

Among the important events of the past year is the erection of a modern foundry and machine shop plant by the Walker & Pratt Mfg. Company of 31-35 Union street, Boston, Mass., manufacturers of the Crawford Ranges, whose advertisement in this issue shows a general view of the new buildings. This plant is now nearly ready for occupancy. It is up to date in every respect, having every modern improvement for improving the quality of the product. Not the least of its advantages is the abundant light which is everywhere available, there being more than 12,000 lights of glass. This plant is being equipped with overhead track for carrying heavy loads through the foundry and more important buildings. The

cupola is served by a complete system of narrow gauge cars. The works are lighted with electricity throughout. At a later date we hope to present to our readers a further description of this factory.

We are indebted to the Shields Foundry Company, Incorporated, Mansfield, Mass., for an exceedingly neat calendar for the new year. The main part consists of a 9 x 11 white card with serrated edges and ornamental corners, and provided with a blue silken loop for hanging it upon the wall. The outer portion of the card forms a border to a central panel carrying a picture in colors. Around the top of the panel are the name and address of the company, together with an indication of the lines of goods which they manufacture. Suspended from the bottom of the card by means of silken loops is a smaller card bearing the leaves for the various months of the year. These are printed in black upon a white ground, and give in addition to the days of the week and month the various phases of the moon. There is also a yearly calendar which will be found of general interest in the same connection.

A calendar for the year 1898, which in design is well calculated to serve the double purpose for which it has been issued, is that sent out by the Co-operative Foundry Company of Rochester, N. Y. Attached to a heavy black card with beveled gilt edges are the leaves constituting the calendar for the 12 months of the year. These leaves measure nearly 10 inches square and are cut to represent a Maltese cross, which stands as a conspicuous feature of the trade-mark of the Red Cross goods. The leaves are red in color and carry in white letters and figures the days of the week and month. At the bottom of each leaf are the names Robinson & Sons, Chicago, Ill., and Lindemann & Sons, Milwaukee, Wis., these being agencies for the Red Cross goods in the sections designated. A loop of gilt chain running through two eyes in the top of the large card serves as a means for hanging the calendar upon the wall.

W. H. Colebrook of W. H. Colebrook & Co., Syracuse, N. Y., will have the sympathy of a wide circle of friends in the death of his venerable father, Charles Colebrook, which occurred on the morning of December 26, at his home in Syracuse. Mr. Colebrook was born in Biddenden, Kent, England, nearly 87 years ago. He came to this country when a boy of about 20 years, settling in Charlton Village, N. Y., where he remained for a few years and then moved to Amsterdam, N. Y., where he lived until 25 years ago, when he removed to Syracuse. For the past five years he has been out of active business on account of failing health.

The Magee Furnace Company of Boston, Mass., have extended their already large line of Cooking and Heating apparatus by the addition of a Steel Range, a new two-flue Range called the Shawmut, the Magee Boston Heater, "A" Series, and a full line of Hot Water and Steam Heaters. These goods will shortly be brought to the notice of the trade through their traveling salesmen and announcement in other columns of this journal.

Advices from the South are to the effect that the men who went out on account of a cut of 10 per cent. in their wages by the Atlanta Stove Works, Atlanta, Ga., decided at a recent meeting to reject the new scale of wages. Alexander S. Seals, vice president and general manager, in speaking of the matter is reported by the Atlanta *Constitution* to have said: "The men quit because we cannot now afford to pay them the wages we did when our business was brisk. The yellow fever kept our men out of the infected districts, where we had a large trade. Our orders from this source have been cut off. The warm weather during the autumn has been such that people have not needed as many Stoves as usual, and low cotton has kept our products out of the country districts. We cut the wages for these reasons. If the men want to come and work for what we offer they can do so, otherwise we do not need them, and they can remain out as long as they like. We have a few men who will make our force as large as necessary. Only recently we reduced our number of workmen from 35 to 20, and we can do without them until our trade improves. Some of the men wanted to lend us a part of their wages, but we did not wish to borrow, preferring to keep down expenses. That is the situation as we see it, but we are sorry we cannot employ all the men at the regular scale of wages."

The Fuller & Warren Company, Troy, N. Y., advise us that they have just received a diploma from the Rutland County Agricultural Society, Rutland, Vt., dated September 14-16, 1897, reading: "Highest Award to Fuller & Warren Company, Troy, N. Y., for Exhibit of Stoves and Ranges."

A small fire in one of the frame buildings of the Lebanon Stove Works, Lebanon, Pa., caused considerable excitement for a short time one day recently. The entire fire department responded to the alarm, which was sent in from a private box at the corner of Eighth and Water streets about 7 o'clock. The flames, however, were under control before they gained any headway, and the damage was consequently of little account.

The Monarch Stove & Mfg. Company of Mansfield, Ohio, have a new catalogue in the hands of the printer and expect to be able to distribute it among the trade by the 15th inst. They also have in contemplation a number of new goods which they expect will keep the Monarch at the front of the procession, and are preparing for a very large increase over the past two or three years' output.

A Brooklyn clergyman was compelled to announce to his congregation on last Sunday that they had better retire while singing a hymn, as there seemed to be a fire in the basement that was not of a serious character. The trouble was due to hot air pipes from a furnace being placed too close to the wood work. On drawing the fire and removing the pipes the firemen found their work completed. From this it would seem that the old method of piping furnaces is open to improvement, even though there are thousands in use under exactly the same conditions that never interfered with the devotions of a congregation.

The Atlanta Stove Works of Atlanta, Ga., are favoring their friends in the trade with a calendar for the new year in the shape of a poster embellished with a very pretty design lithographed in colors. The poster is provided with metal strips at top and bottom, and has a metal eye for hanging it up. The leaves for the different months of the year are attached to the lower right hand corner, the printing being in deep blue upon a white ground. The various phases of the moon are given in connection with the days of the week and month.

The Mississippi Valley Stove Company, manufacturers of Solar Stoves and Ranges, are distributing a very pretty wall calendar. It consists of a card 9½ x 13 inches in size, in the center of which appears a rural scene in colors. Flowers are embossed in colors around the border, which is also decorated in open work. The calendar itself occupies a small space at the bottom. A ribbon is supplied for hanging it. Those who received the company's Phœbe calendar last year and thought that a work of art will be just as highly pleased with this year's beautiful reminder, although it is of a different type altogether.

The Mayer plating dynamos manufactured and sold by Maxwell M. Mayer, 335 107th street, East River, New York, are illustrated and described in a neat pamphlet which Mr. Mayer is distributing to the trade. A general description of the dynamos is given and a half-tone engraving illustrates the interior of his works. At the back are testimonial letters and prices of nickel plating outfits.

The interest in the class in electrical work at the New York Trade School has been remarkable this year. A class of 50 is receiving instruction, though there were 90 applications. On December 28 a lecture was given in the Trade School Auditorium on "Some Interesting Facts About Electricity," by Arthur A. Hammerschlag.

A suit has been begun in the United States Circuit Court of New York against the Standard Oil Company and others by the United States Pipe Line Company of Pennsylvania, charging conspiracy to crush out competition and asking for $350,000 damages. The complainants allege that a conspiracy has been in existence since January, 1882, to prevent any persons or corporations other than the defendants from storing or transporting oil and conducting operations relating to that business. They further complain that the Standard Oil Company by intimidation have prevented merchants from dealing in oil transported by the complainants, and have sold oil at ruinous prices in the markets where oil transported by the complainant company was offered for sale. Among other points, it is related that the Standard Oil Company, in order to keep out competition, frequently chartered all of the available oil vessels regardless of the number needed for their own business. The defendants in their answer make a general denial of the charges and intimate that the Pipe Line Company were not organized for the storage and transportation of oil as a common carrier.

The coal mining companies in Japan are introducing Corean laborers into their mines, finding them more able to stand hard work and more amenable to discipline than the natives.

The Globe Shipbuilding Company, Cleveland, Ohio, have secured control of the Shipowners' Dry Dock Company of that city, a concern capitalized at $380,000. The Globe Company have purchased $250,000 worth of the stock.

HEATING AND PLUMBING.

The Steam and Hot Water Heating Trade.

A large number of letters from manufacturers of steam and hot water heating apparatus and appliances give evidence of an increased production for the year just closed, but unfortunately these letters also report, almost without exception, that the business has been done on a narrower margin of profit. The business in prospect for the New Year gives promise of better things. Our correspondents report that they find architects engaged with work that is to be carried out, and already there is some reason to believe that the demand may be more in proportion to the production with a corresponding benefit to prices and profits. What is true of every year since '93 is true of the year just closed. Competition has been sharp. During the last half of the year business was better, and this with the increase in demand natural to the fall season relieved the competition somewhat by occupying the trade and put things on a more satisfactory basis. The opinions as to collections vary, with some show of improvement, however, particularly in the West, where good crops were disposed of at good prices. We print below extracts from a few of the letters we have received :

The S. Wilks Mfg. Company, Chicago: Our business has been in excess of 1896. The margin of profit has been less, as there has been no decrease in the cost of material, and during the latter part of the year there has been an advance in steel, rivets, &c., and competition has been strong in all goods in our line. Collections have been fairly good until nearly the close of the year when they dragged considerably. In figuring up their year's business we think many parties, particularly in the plumbing and heating line, will not find much, if any, profit, as there has been a very strong competition among the different plumbers and fitters, and many jobs have been taken too low. There seems to be a large amount of building thought of for the coming year, the fulfillment of which will depend largely on the condition of the labor market. If there should be any strikes they will stop a large amount of prospective building.

The John Davis Company, Chicago: The past year's business has in almost all respects been better than that of the preceding year. The profit has been about the same, though there have been attempts made to improve conditions during the year, and on the whole prices may have been somewhat better. To us it appears that the prospects for the coming year are good.

Thomas Devlin & Co., Philadelphia: We regret as much as anybody can the fact that the year drawing to a close has been a very bad one for profits in our line of business.

One of the leading manufacturing houses in the country write: Relative to the future we can only guess. We are well satisfied that what the country needs is rest from political agitation, but it does need to have the currency question settled on a sound basis. These satisfactorily disposed of we should look for a considerable stimulus and demand for goods, but we can hardly see any reason why there should be a very much higher level of prices.

Boilers.

An accurate report of the number of boilers sold, if it could be obtained, would probably show an increase of 15 or 20 per cent. over the preceding year, and yet it is doubted if the amount of these sales in dollars and cents would be as great. Among the reasons for this condition is the large number of small boilers that have been brought out during the year, and which, owing to the sharp competition, have been used instead of the larger and better adapted boilers used in the past. This has all tended to reduce profits, and in the effort to cut down the cost of doing business the salesmen have felt the hand of retrenchment, although their labors have increased. The following letters present the views of some of our correspondents:

The American Boiler Company, Chicago: There has been a large increase in the volume of business and our orders equal those of '95. Collections have been fairly good and we look forward to a decided increase in business for the coming year. Prices are much lower than a few years ago, but there is a larger amount of business to be obtained.

John Best, Lancaster, Pa.: Business this year is no better than '96. If anything we have been working on a closer margin of profit than ever before. The outlook for the coming year is encouraging. We have a few nice orders in already.

Morgan & Co., Chicago: Of one thing there can be no doubt, the price of the ordinary boiler has come to a point where it cannot be lowered, if there is no reduction in the price of the materials of which it is made. We think that there has been a material reduction in the cost of marketing boilers. The boiler man is becoming more conservative in making prices, and, on the whole, everything points to more prosperous times.

The Gurney Heater Mfg. Company, Boston: Our experience leads us to the conclusion that business for the past year was largely confined to heating buildings already in existence, whereas the expectation regarding the future is that house building will be resumed at no very distant date, and that the present intense competition will be mitigated by the demand coming somewhere near to the supply.

Radiators.

The amount of radiation sold during the year was greater than the amount distributed during the year preceding, but from the reports at hand the prices secured were not altogether satisfactory, the margin of profit being narrower. The influence of manufacturing plants that were got into good running order during this year for the first time was felt when the marketing of their product began. These plants, as well as the old plants, report an increased volume of business, and all seem to agree that the prospects for the coming year are encouraging, although an advance in price is not expected during the early months. From letters received, we quote as follows:

The United States Radiator Company, Dunkirk, N. Y.: Our business has been larger in volume during the year 1897 than at any time during the history of our company. Prospects for another year seem bright, and while we are not expecting any radical change in prices, we believe that if any occurs it will be in the nature of an advance to cover the increased cost of raw materials.

The Fowler Radiator & Mfg. Company, Johnstown, Pa.: We are pleased to state that the volume of our business for the year closing has been at least 50 per cent. more than for the year previous. Collections also have been somewhat easier, although there is still room for considerable improvement in this line. The prospects for business the coming year, we think, are very favorable, but do not anticipate any material advance in prices in our line. Any increased margin of profit, we think, will have to be made by cutting down the cost of manufacture.

The Holland Radiator Company, Chicago: We have had a most satisfactory year in every respect. Our collections have been satisfactory and our works have been taxed to their utmost in filling orders. Prices have been low, but we hope for better next year. From all indications we expect an excellent trade for '98.

A large Western house say: More radiation was sold in '96 than in any previous year in the history of the trade. The conditions under which the business was done have made the prices, on the whole, unsatisfactory, with no immediate prospects for an improvement.

Another large house say: Our output has been increased, but the competition has interfered with the profits. We made a special effort on our best goods, on which we secured better prices.

Steam Specialties.

The various productions known as steam specialties, as well as standard supplies, have met with an increased sale, but in the sharp competition for business prices have ruled lower, with a corresponding effect on profits. Some effort has been made during the year to advance prices, and in some lines it has been successful, but in others the effort was not well sustained. A number of houses have entered the field as selling agents, and in handling several lines have reduced the cost of selling to the manufacturer. The low prices on standard goods have caused a greater effort to be made to produce specialties that would earn a profit, and a number of new appliances have made their appearance. Some of our correspondents express themselves as follows:

The James P. Marsh Company, Chicago: The volume of our business for 1897 has been at least 25 per cent. better than in 1896. The net profit has not increased. We consider the prospects for 1898 extremely good.

The Frontier Iron Works, Detroit, Mich.: Our brass valve trade has largely increased during the past year. There has been no material change in prices, although perhaps they have been a little closer and the margin of profit smaller. We do not expect prices to go much higher next year, but we do look for a good business.

Bartlett Brothers Company, Cleveland, Ohio: We find trade better than last year, and look forward to a better business next year, as public buildings and schools have been neglected during the late financial depression, but cannot be neglected any longer.

Beaton & Corbin Mfg. Company, Southington, Conn.: The first three months of last year were a little better than the corresponding months of this year, but since July 1 the trade has been one-quarter better. Prices have held about the same, and the prospects for improvement in the trade are good.

Collections and Failures.

A closer scanning has been given this year to the financial responsibility of the buyer, and the effect has been that many losses have been avoided and the number of failures for the year has been smaller. This has also had the effect of improving collections, and although during the dull seasons money was slow in coming in a very satisfactory improvement was felt during the late fall months.

John Davis Company, Chicago, write: There is a very marked difference in collections, and at the present time country collections are better than they have been at any time since the present depression began.

A prominent New England house say: There is no difference in collections which can be called unfavorable. So far as we are concerned, collections may be said to be good, and losses during the year just past seem to be reduced to the minimum.

Foreign Trade.

There has been a very substantial increase in the amount of goods shipped abroad, and a larger number of business houses now have foreign customers to whom regular shipments are made. The shipments include boilers, radiators, valves, pipe, fittings and tools. Some houses maintain branches abroad, and several have arranged with foreign dealers as agents. Special trips have been made to investigate this field for business, and it has been found that our goods are well adapted for the market, a strong preference having been shown for those of the best quality.

The Associations.

The American Society of Heating and Ventilating Engineers held a very successful meeting in January, and under the administration of W. M. Mackay, the president elected, a midsummer meeting was held. A large increase in membership will be reported at the next annual convention to be held January 25-27, 1898, which already gives promise of being very interesting.

The National Association of Master Steam and Hot Water Fitters has maintained a headquarters in the Wool Exchange Building, New York, which under the efficient management of Secretary Henry B. Gombers has been a great benefit to the members during the close of the administration of President Arthur C. Walworth and under the present administration of President E. D. Smith. In New York City the local association is, in co-operation with the local Master Plumbers' Association, making an effort to secure better trade protection.

The Plumbing Trade.

The year in the plumbing trade has been unsatisfactory, so far as is recorded by the balance sheet. The scarcity of business which marked the opening months so affected prices that goods which were formerly standard were entirely supplanted by productions of a higher grade in appearance, convenience and quality. The reports at hand from a good representation of the trade show that the last half of the year brought an improvement in collections and an increase in the volume of business, but unfortunately the prices failed to keep pace with the other improvements, so profits were most unsatisfactory. Other notable features of the year have been the increasing interest in trade protection and in legislation to raise the character of plumbing work done in all kinds of buildings to the level of modern sanitary requirements.

The Associations.

The annual convention of the National Association of Master Plumbers, held in New York in June, was well attended. The next convention will be held at a time to be set by the National Executive Committee at San Antonio, Texas. The officers are:

President, Thomas P. Culloton, Chicago.
Secretary, J. G. Roland, Chicago.
Treasurer, Wm. E. Goodman, Milwaukee.

There are three associations of manufacturers of plumbing goods for the purpose of protecting their interests in credits, collections and uniform prices and trade concessions. Their interests are centered in Chicago, New York and Boston, and known and officered as follows:

THE CENTRAL SUPPLY ASSOCIATION.

President, Alfred Fowle, Jr., Milwaukee.
Secretary, Geo. F. Ross, Chicago.
Treasurer, W. E. Clow, Chicago.

THE EASTERN SUPPLY ASSOCIATION.

President, B. Frank Hooper, New York.
Secretary, E. W. Lowe, New York.
Treasurer, W. C. Trageser, New York.

THE NEW ENGLAND SUPPLY ASSOCIATION.

President, Frank J. Knox, Hartford, Conn.
Secretary, John B. Dupee, Boston.
Treasurer, W. L. Whittemore, Boston.

Trade Protection.

The small profits and sharp competition of the year have brought home to the plumber the necessity of selling all of the material he works and greater interest has

been taken in trade protection. Elaborate propositions have been compiled and presented to the wholesale trade, and the close of the year finds the subject still under harmonious discussion.

Sanitary Legislation.

Throughout the country greater attention has been given to the enactment of laws to secure sanitary plumbing. Bills were introduced in the legislatures of several States last winter to provide for the regulation of plumbing work and for the examination and licensing of competent men. In some States they became laws and benefit has attended their enforcement, while in others they failed, but the efforts will be renewed in the legislatures about to convene.

In Massachusetts a law was passed applying to the city of Boston requiring that gas fitting must be done by licensed gas fitters and subject to official inspection.

Extracts From Letters.

From a great number of letters received from the trade we present extracts from a few, as follows:

Monitor Iron Works, New York: While business with us has been larger in tonnage, it has been very much smaller in value received this year compared with last. The margin of profit has been materially reduced since last year. Collections have been fairly good, compared with last year. As to future prospects, no fellow can find out to a certainty. The prospect is by no means good in our trade. Overproduction and no foreign outlet seems to confront us. While these conditions remain no large advance in prices is at all likely. Prices to-day are lower than ever before in our goods.

Henry Huber Company, New York: Business this year has shown an improvement over last, but we attribute this more particularly to the fact that we have made extra efforts. Prices as a rule are lower even than they were in 1896. We anticipate in the year 1898 it will be better, but we have no hopes of material improvement in prices.

Hays Mfg. Company, Erie, Pa.: The opening of the year 1897 found trade very light, business in general throughout the country was quiet, and as a result what little could be brought about was the result of objects in price more than actual need of goods. Toward the middle of the season a change for the better was noticeable, prices, although remaining low, were held more firm and the trade placed confidence in the turn of affairs in a material way. Later during the year improvement was well marked and the influx of business was very gratifying. Many of the towns and cities have been pushing to completion long delayed municipal improvements, which has given impetus to our particular class of goods, and the open, favorable weather continuing throughout the entire fall has carried the good results well to the close of the year and has put us considerably behind our orders, making it necessary for us to run day and night and with increased forces of men in order to make some headway. The last three months have shown an increase of over 50 per cent. covering the same period last year. To us the year 1898 is very promising, owing to the municipal improvements now in contemplation and that have been carried along awaiting trade revival. And with this better feeling will no doubt come a restoration of living prices and the demand for good material—quality not quantity will be given the preference.

The Day-Ward Company, Warren, Ohio: The year now closed has been a fairly prosperous one in our line of business. The amount of goods used has been greater than in any previous year of our experience, and while the margin of profit has been smaller the increase of business has, perhaps, offset this to a large extent. In regard to collections we think that perhaps during the last quarter of 1897 they have been a little slower than in the previous nine months, but we consider them fairly good, everything taken into consideration. In regard to the coming year the outlook seems to be good for a large volume of business, and there seems to be a general expectation by both manufacturers and dealers that higher prices will prevail and that the margin of profit, which has been reduced by the strong competition, will be increased. Our own opinion is that the coming year will see a somewhat higher range of prices, although we believe that the strong competition in the manufacture of plumbing supplies will prevent anything in the nature of a boom, and that any advance which may come will be legitimate and will be largely brought about by the increased consumption.

H. Mueller Mfg. Company, Decatur, Ill.: Our business the first part of the year was no improvement over last year. We find that the last few months has been very much better than the same time last year, and, taking it as an aggregate for the year, our business will show some improvement over last year, but we hardly look for much better profits this year, as prices have been demoralized for some time and it will take time to advance prices. Still, we are confident that prices will be higher next year. This is a fact, as you cannot contract for goods to be delivered during the year of 1898 for the same price at which you could purchase goods for this season. We consider prospects for this coming season very bright and a great deal better than for some time past. We think there will be much more public improvement, such as construction of water works and extension of water works, than for some years, as money is much easier, and therefore it will be easier to sell bonds in order to make public improvements. We find collections much better than last year at this time.

Charles Millar & Son, Utica, N. Y.: Business this year has been somewhat disappointing. It is about the same as it was in 1896 and, while the conditions seem favorable, the volume has not been materially increased. In some sections of our territory our customers complain much more than they did during the previous year, but in other sections there has been a noticeable improvement. Collections on the whole, we think, are better, and there have been fewer failures, but still they are sufficiently numerous to make it advisable to exercise great discretion in granting credit. We think the prospects for the coming year are good and we expect before the year is over to see extremely prosperous times. We may be disappointed in regard to this, but unless some foreign complications arise are quite sure that there will be a great improvement.

Instantaneous Water Heating Company, Chicago: Our sales this year will exceed those of last fully 30 per cent. The last three months have been particularly encouraging and our sales for November of this year were the largest in our history for that month. The margin of profit on our goods has practically remained the same and our collections the past few months have been most satisfactory. We are of the opinion that the year of 1898 will be the most successful one that our manufacturers and merchants have experienced for a long time, and feel confident that such will be the case.

Illinois Malleable Iron Company, Chicago, Ill: While business in the early part of the year was not encouraging in its volume, during the past few months there has been a decided and notable improvement in the condition of trade, and we are sanguine about the future. We base our opinion on the fact that the improved prices now ruling for farm products bring better times to the farmer, and in the redistribution of the surplus the farmer will accumulate the entire commercial world will share. We therefore believe that the coming year is full of hope, and that business transactions will be greater in number and of larger volume than in the immediate past.

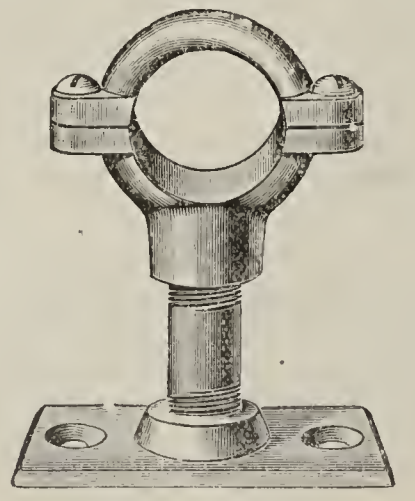
Naugatuck Mfg. Company, Naugatuck, Conn.: We have found business improving through the past year, particularly during the last three months. As to the matter of margin of profit, we do not see any increase in that yet, but we notice that collections are improving, especially September, October and November. We do not look for any advance in prices on the articles we manufacture, but are hoping, and we trust with good reason, for an increase in the volume of our trade, and in anticipation of an increase of business we are increasing our facilities for handling it.

King Mfg. Company, West Troy, N. Y.: We have had an encouraging increase in the volume of our business during the past year, with no appreciable difference in the margin of profits. Collections are made with difficulty, showing little if any improvement over last year. Still, there can be no question but that the general condition of trade shows a marked improvement, and we look with confidence to the coming of an era of more abundant prosperity.

W. & B. Douglas, Middletown, Conn.: We have found business in 1897 about the same as the previous year with us. Prices are very low and the margins of profits are considerably reduced. We think that the coming year will be a more profitable one in every way, as the confidence of the people in the Government is gradually being restored and the currency is now on a pretty solid footing, if Congress will only leave alone any ideas as to the banking department of the country. There is one thing that ought to be understood, that the manufacturers of this country are selling their goods too cheaply to-day, and the evidences all about us are that the largest manufacturers will have to go into a combine so that they can sell their products and afford a fair margin.

State President Tute at Worcester.

An enthusiastic and well attended meeting of the master plumbers was held in the Builders' Exchange, Worcester, Mass., Tuesday evening, December 21. Among the special attractions of the evening was the presence of Thomas J. Tute, president of the State Association, who stopped in Worcester *en route* for his home in Boston, after a week of missionary service in Westboro and Springfield. President Tute gave an interesting report of the work that the master plumbers are doing in Massachusetts and in other States, and spoke at length with regard to the measures that are now being seriously considered by the several State organizations and the National Association.



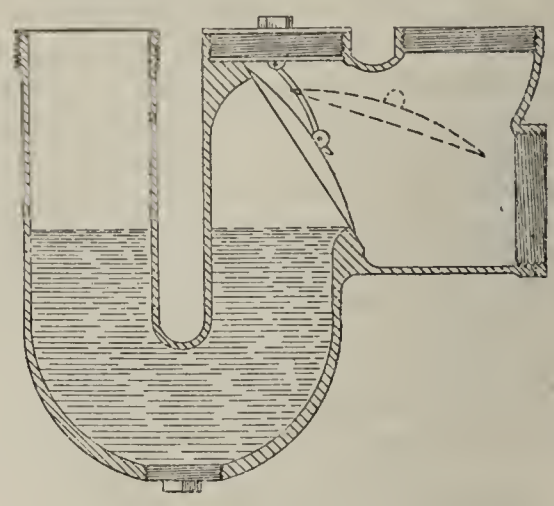
Following the talk by Mr. Tute matters of interest to the master plumbers were discussed. The plumbers are greatly interested in securing a uniformity among the manufacturers who sell plumbers' supplies, and to prevent the wholesalers retailing and thus injuring the regular retailers. The master plumbers are looking forward to the State convention, which will be held in Taunton, January 13. One of the advantages of the plumbers' convention is that every recognized plumber is a delegate in himself, and no formal elections of delegates by the various associations are held. Several from the Worcester branch are planning to attend. The annual election of officers of the Worcester Association will be held February 1.

Chicago Master Plumbers' Association.

At the meeting of the Chicago Association of Master Plumbers, held on Tuesday, December 28, J. J Wade was elected president. The other officers chosen included vice-president, Charles J. Boyd; secretary, Samuel Smith; treasurer, Thomas C. Boyd, and sergeant-at arms, Joseph Scheuer. Messrs. Smith and T. C. Boyd were reelected. The other members of the Executive Committee, which embraces the president, vice-president, secretary, treasurer and the retiring president, Thomas Conlin, are Paul Redieske, Charles J. Byrne and D. J. Tierney. The election of Mr. Wade to the presidential office was a long delayed honor to an old wheel horse who has served faithfully and untiringly in the cause of sanitary advancement.

Extension Pipe Hangers.

In the accompanying illustration we show one of the varied line of pipe hangers for brass and iron pipe made by Fee & Mason, 66 Beekman street, New York. This



Extension Pipe Hangers.

hanger consists of a pipe clasp, a nipple and a plate, designed to be secured to the building. The plates are made with two or three tapped openings for double and triple hangers when desired. The connecting nipple is made of ¼-inch pipe and 4 inches long, unless otherwise ordered. The hangers can be furnished in polished brass or nickel plated for fine plumbing or galvanized for ordinary work. They are made for all sizes of iron pipe, from ½-inch to 2-inch, and can be furnished without the connecting nipples when desired. A six-page folder, showing their complete line of plain and fancy hangers, can be secured on application.

The Sanos Back Water and Sewer Gas Traps.

The special feature claimed for the Sanos sewer gas and back water traps, shown in the accompanying illustrations, is that they afford a positive acting non-siphoning

The Sanos Back Water and Sewer Gas Traps.—Fig 1.—*The Sanos Basin and Sink Trap.*

automatic valve trap that cannot be deranged by clogging or the action of temperature or acids, while the construction renders every part accessible without the use of special tools. These traps are manufactured by the National Sanitary Supply Company, 147 Centre street, New York City. Fig. 1 represents a basin and sink trap in which it will be noticed at the right there is an outlet, and immediately above it is an opening for connecting the vent pipe.

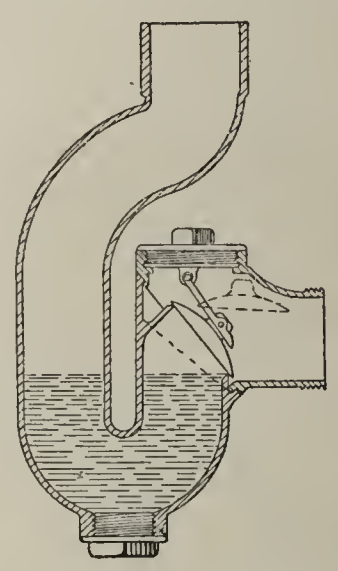


Fig. 2.—*The Sanos Urinal Trap.*

To the left of the vent connection is a hand hole opening closed by a brass screw. On removing this brass screw the valve of the trap may be lifted out. This valve is arranged so that when the fixture is discharged it raises and allows the contents of the fixture to pass unimpeded to the drain pipe. The weight of the valve is sufficient to prevent its being raised and the seal of the trap being broken by siphonic action. In case of the line of waste

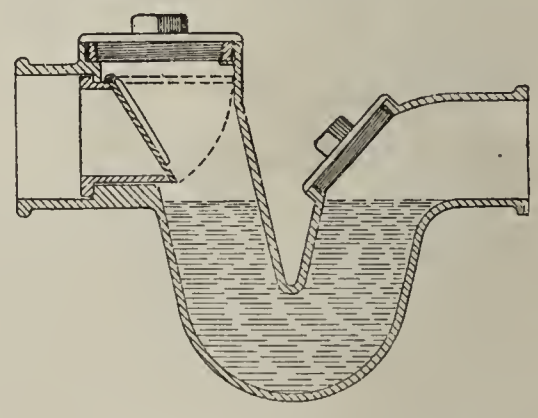

Fig. 3.—*The Sanos Running Trap.*

pipe being clogged it is impossible to flood the fixture through the trap, as the valve becomes a positive stoppage against back pressure either from fluids or from gas. Fig. 2 is a urinal trap designed to meet the regulations of cities where the urinal trap must be exposed and not hidden behind the slabs of the stalls, as has been the custom in many instances. The entire trap is entirely beneath the urinal on the outside of the slab, the outlet being arranged to pass through the slab and connect with the vent and drain pipe. It will be seen from the cut that the valve is

so arranged as to prevent flooding the fixture or breaking the trap seal from back pressure. Fig. 3 is a combination back water valve and running trap, designed to meet the New York City regulations, trap screws being placed conveniently for removing any obstacle in the trap and the valve so located as to serve as an effective barrier against flooding or gas from the sewer. Fig. 4 is a back water and sewer gas trap designed for use in connection with the ordinary running trap or in its place, the valve arrangement serving as a barrier against the entrance of sewer gas and also preventing a flooding of the building. This trap is made in all sizes from 3 to

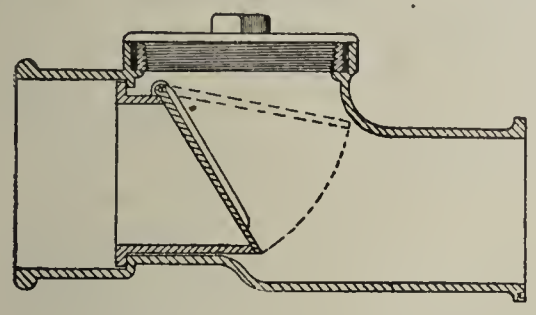

Fig 4.—The Sanos Back Water and Sewer Gas Trap.

12 inches in diameter. The running trap is made from 3 to 6 inches. The basin traps are made 1½ inches in diameter in plain brass or polished and nickel plated. The urinal traps are made from 1½ to 2 inches in size in various styles of finish. The company publish a catalogue of these goods, giving full descriptions and price-lists, and also giving letters from Charles F. Wingate and George W. Hunt, prominent sanitary engineers, who have expressed themselves favorably in reference to the construction and efficiency of the trap.

The Lee Exhaust Head.

The noiseless centrifugal exhaust head manufactured by Thomas Lee, 209 Race street, Cincinnati, Ohio, contains no baffle plates, and is so designed that there is no

The Lee Exhaust Head.

back pressure. Upon reference to the engraving it will be noted that there is a large condensing surface, the condensation being effected by centrifugal motion and expansion combined.

White Mfg. Company, 158 Indiana street, Chicago, have issued an advance sheet of Hot Blast Gasoline and Kerosene Appliances for brazing, enameling, soldering, electrical wiring, melting metals, &c., comprising the Mammoth Brazer, the Combination Brazer and Forge, the Electric Railway Bond Brazer, the Imperial Torch, the Electric Torch, the Combination Soldering Iron Heater, the Kerosene Tinners' Furnace, the Perfection Tinners' Furnace, the Silent Friend Combination Furnace, the Baby Mammoth Brazer, Hand Brazers, Torches, Enameling Ovens, &c.

Blessed be Ignorance.

How frequently we are surprised to find the conductors of great newspapers totally ignorant of what is happening under their very noses. Here, for instance, is the Chicago *Tribune* extolling in a leading editorial the formation of a master plumbers' league in the Southern States, "organized for the prevention of disease by sanitary plumbing," &c., and after elaborating on its benefits asks, "But why should the beneficence of such a league be confined to the South? Is it not needed also in the North?" If the sapient editor inquires among his Chicago neighbors he will find that one of the very first organizations of the kind in this country was long since established by the master plumbers of his own city and that no stancher league exists than the Tri State League of Illinois, Iowa and Wisconsin. The organization has done a great deal of hard work, but somebody on the *Tribune* doesn't know it.

NOTES.

The Walcott-Webster Mfg. Company are moving their downtown salesroom into more roomy quarters, at 55 Dearborn street, Chicago, and are fitting up a most elaborate display of samples of high grade Plumbing Goods.

The next annual convention of the New York State Association of Master Plumbers will be held in Binghamton, N. Y., March 1, 2 and 3. It is expected that between 250 and 300 visitors will be present, including T. P. Culloton, president of the National Association of Master Plumbers. The convention was the principal subject of discussion at a meeting of the Binghamton local association, held December 23 at the Lewis House. The meeting was held principally to listen to a number of suggestions offered by W. S. Reed of Rochester, president of the Master Plumbers' Association of this State, as to arranging for and managing a convention of this kind. Committees will be selected at a meeting to be held January 3. The convention hall and headquarters will then be decided on and other arrangements completed.

Hugh McPartland has purchased an interest in the Plumbing, Steam Fitting and Furnace business of C. C. Kunzleman, 128 Bank street, New London, Conn.

C. Probert has purchased an interest in the Plumbing business of W. J. Price, at Fargo, N. Dak., and the new firm will be known as Probert Plumbing Company.

The difficulties of reaching the Klondike may be readily understood by those who have received in their mail the Yukon Puzzle sent out by the Standard Steam Specialty Company, 83 Centre street, New York. All will not wait to solve the problem before accepting the invitation to write for their complete list of specialties and prices.

Crawford Arnold, a retired manufacturer of Gas Fixtures, &c., died suddenly at his home in Philadelphia, on December 25, aged 68 years. He was born in Providence, R. I., and going to Philadelphia on the completion of his education began his business career with the firm of Cornelius & Sons. Eventually he became a member of the firm, when they were known as Baker, Arnold & Co. Mr. Arnold retired from business several years ago.

The Bay State Metal Works, Cambridgeport, Mass., have added to their line during the year Steel Clad Baths, Enameled Steel and Solid Copper Bathtubs which have found favor with the trade in their section.

Fleck Brothers, Philadelphia, Pa., inform us that during the year they have added to their business the manufacture of Lead Pipe and have increased their facilities for handling Soil Pipe and Terra Cotta Pipe.

The Allegheny Heating Company, Pittsburgh, Pa., on December 21 declared the regular quarterly dividend of 3 per cent. and an extra dividend of 5 per cent.

Bids will be received until January 15 for plumbing and draining the Biological and Dairy Building at the New York Agricultural Experiment Station at Geneva, N. Y.

At a special meeting of the Master Plumbers' Association of Washington, D. C., held Tuesday night, December 21, the largest attendance on record was present. An election of officers was held, which resulted in the unanimous choice of William Koch as president; H. J. Allen, vice-president; E. J. Hanna, secretary; Charles Barrick, sergeant-at-arms, and Daniel Hannan was re-elected treasurer. It was decided to accept District Commissioner Black's suggestion to the association not to withdraw its representative on the Plumbers' Examining Board at the present time, and also to submit the views

of the association upon what the composition of the examining board should be.

Martin & Vezina, Montreal, Canada, plumbers, have dissolved.

M. L. Davidson, tinsmith and plumber, has moved his shop to Anaheim, Cal., where he intends to locate.

W. G. Allen has opened a plumbing establishment at Main and Cato streets, Woonsocket, R. I.

An amendment to the present ordinance for boiler inspection was passed on recommendation of the Judiciary Committee of the Chicago Board of Aldermen. The new measure makes the fees for inspection $5 and $3 per boiler, instead of $3 and $2, which was the rate established a year or two ago. The higher rate had been collected for years past. The new ordinance also has a penalty provided for non-compliance with its terms, and includes the inspection of low pressure boilers in apartment buildings.

Owing to L. H. Buddemer of Portland, Ore., retiring from the plumbing business, President Thomas P. Culloton of the National Association of Master Plumbers has appointed H. Claussenius, 422 Washington street, Portland, Ore., as State vice-president for Oregon.

The Ronalds & Johnson Plumbing Company, Hainesville, N. J., have been incorporated. The articles state the capital to be $800,000, paid in full. The office will be in Hainesville, N. J. The object of the company is to manufacture Plumbers' Supplies. The principal stockholders are P. Lorillard Ronalds, Jr., of New York and John D. Johnson of Mount Holly, N. J.

The regular meeting of the Master Plumbers' Association of London, Canada, was held in the association room, Robinson Hall Chambers, on Thursday evening, December 16, with all the members in attendance. The following officers were elected: Thomas L. Partridge, president; Ed. Holland, vice president; W. Skelly, Jr., second vice-president; James R. Haslett, secretary; Wm. Smith, treasurer.

The L. H. Prentice Company, Chicago, Ill., send out an illustrated price-list of Prentice Extension Floor Thimbles, Exhaust Pipe Heads and Register Shields. These goods, which will be of interest to the trade, are illustrated and briefly described.

Pipe Threading and Cutting Tools are illustrated and described in a catalogue issued by the Merrill Mfg. Company, Toledo, Ohio. Fine engravings show very clearly the special features of these machines, and in some cases detail engravings of broken views are presented. In all cases a thorough description is given, so that the reader can understand exactly the merits and special features of the machines. Prices and tables of sizes are likewise presented.

Henry H. Guernsey, 6 Church street, New Haven, Conn., has added to the line of celebrated Royal Hot Air Furnaces, which have proved so popular in New Haven, a complete line of Royal Hot Water and Steam Boilers, and is now prepared to do all kinds of heating.

W. A. T. Smith, New Haven, Conn., is installing one of the Kelsey Furnaces in Frederick G. Cooper's new residence and two for D. T. Ryan. Mr. Smith is also putting one of the same Furnaces in the Y. M. C. A. Building. By means of the hot water attachment hot water is supplied for the baths in the gymnasium.

Making Illuminating Gas.

In the manufacture of illuminating gas various processes are necessary, and the following is an account of the methods followed in Grand Rapids, Mich., as described in one of the local papers :

There are three systems for the production of illuminating gas in general use. The products are coal gas, water gas and that made directly from oil. Two of these, coal gas and water gas, are made in this city, and the admixture of the two produces the gas that is furnished to the consumer at the present time. In former days, before the advent of the electric light, the residents of Grand Rapids were greatly pleased to be able to have coal gas alone, but with the introduction of the new light came the effort to furnish something better than the coal gas, and the water gas system was introduced, and to-day the city is being supplied with what is admitted to be the best gas for general purposes. Coal gas is generated by the heating of soft coal to an intense heat, usually about 2500 degrees, in retorts of clay, which are heated to a white heat. After these are heated the coal is heaved into them and they are hermetically sealed to exclude the air. The coal cannot burn up, as there is no oxygen, but the intense heat drives out the gas, the process lasting four hours. The furnaces for these retorts are immense ones and each contains three retorts, one above the other. The heaving of coal into these must be done quickly and the work is by no means a pleasant task. But it is interesting to the visitor to the works to observe the perfection with which this is done. The men, two working together, do not stop to see where they are throwing the coal, but they throw it into the retorts and none of the chunks miss the opening. After the coal has been heated for the required time it is drawn out of the long horizontal retort and drops to the floor in white heat. It is then gas coke, and is used in creating the fire under the retorts, as it is regarded as the greatest heat producer. The excess of the coke over that used in the works is the commercial coke consumed about the city after it has been screened and placed in the coke house.

The retort was said to be hermetically sealed, but it is not strictly so, there being an ascension pipe through which this crude product goes into the hydraulic main, in which considerable tar, ammonia and other impurities held in suspension are separated by gravity. The gas passes on to the exhauster in another building. This is a complicated pump used to reduce the back pressure that would otherwise remain upon the retort by reason of the distillation of the gas and force it through the remaining apparatus and into the holder. The gas is then forced through the tar extractor, another piece of complex machinery. At the entrance of this the gas is highly charged with tar, and the product emitted from a stop cock will badly smear a piece of paper held at the exit. When a stop cock is opened at the opposite side of this machine a strong scent of ammonia is detected, and after the tar has been carried away to proper receptacles to be put to use the process consists in the removal of this ammonia and some other impurities, the most prominent among them being sulphur.

The ammonia is not wasted, but goes through a perfecting process and becomes commercial ammonia. From there the product passes to the condensing and cooling apparatus, which consists of four upright steel cylinders 4 feet in diameter and 30 feet high. Next are the scrubbers, which are two like cylinders and extract the ammonia. The condensation is necessary for the extraction of the ammonia and the sulphur. Now the product passes to the purifiers, the province of which is to extract the sulphur. These are rectangular iron boxes of varying sizes, those used for the coal gas being 16 feet square and about 4 feet high. Inside of these are three shelves, on which is placed the material through which the gas must trickle to take out the sulphur. The gas is admitted at the bottom and passes slowly up through the composition. This material is made of iron turnings, which are prepared by being mixed with wood shavings and sawdust. Salt water is thrown upon these and causes the iron to rust, making iron oxide, which decomposes to form a compound of iron and sulphur. The material is taken out periodically and evaporation works another change, fitting it for use again, but it finally has to be discarded. From there the finished product, condensed, cleaned and ready for use, is taken to the station meters, which are immense ones, being 8 feet in hight. These are absolutely accurate down to the fraction of a cubic foot, and it is known every night just how much gas has been produced during the day. Now it goes to the holder.

If it is a dark day or a light day the company have the measurement of the gas actually sold each day and each hour by observing the registration of the meters, so that at the end of the month, before the consumers' meters are read, it is known about how much gas has been sold, and after reading the consumers' meters it can be determined exactly what has been the leakage and condensation, which is, as a rule, from 5 to 15 per cent. The weight of the holder gives the pressure and maintains it sufficiently great to force the gas out into the street mains. After it leaves the holder it goes through the station governor, between the holder and the street mains. This is adjusted to automatically give as nearly as possible a uniform pressure throughout the city, this pressure being maintained at as low a point as possible, as excessive pressure would materially increase the unaccounted for gas by reason of the small leaks throughout the main system.

The water gas generators are large upright cylindrical vessels. Carbon, either anthracite coal or coke, is put into these from the top, upon suitable grates, and ignited. By means of an air blast, created by delicate and complex machinery placed in an apartment by itself, this is blown to a high state of incandescence. The air is then shut off and live steam is turned on under the grates. The steam passing through the incandescent carbon is disassociated, forming fixed hydrogen and carbonic acid gas. This is then carried on into another chamber filled with bricks and known as the carburetor, into which is injected naphtha, which, passing down through the heated brick, is converted into hydrocarbon, which gives the gas its illuminating power. Thence all the gas passes through the superheater, another cylinder filled with bricks, in which it is finally fixed. It now passes through condensers, washers, purifiers and into the station meters, practically the same as the coal gas, and at the outlet of the station meters the two gases are mixed in equal quantities.

SHEET METAL WORK.

Sheet Metals.

A review of the sheet metal trade of 1897 shows a marked improvement in the volume of business as compared with the previous year. As 1896, however, proved a thoroughly disappointing season to the manufacturers and jobbers, there was plenty of room for improvement without the occurrence of anything like a rushing trade. The gain, nevertheless, was sufficiently large to mark the year as one of comparative activity among the sheet iron and steel mills, which ran more steadily than for some time past. From reports we have received from manufacturers in various parts of the country it appears that during the first half of 1897 the volume of orders was merely moderate, although some heavy contracts were placed with a few favored mills in the spring, which carried them over comfortably into the second half of the year. A number of the older and less effective mills, however, remained idle or only ran intermittently. Prices, meanwhile, remained on a low and generally unprofitable level. During July most of the sheet mills were closed down pending the settlement of the wage scale, but toward the end of that month they resumed full work with a large volume of orders, which had accumulated during their idleness. Several hitherto inactive mills also started into operation at the same time. Meanwhile, there was a slight stiffening in prices, which, however, was soon checked by the material increase in the output.

During the late summer a number of the sheet mills were much hampered in their operations by the coal strike, which also affected the steel works, and caused much inconvenience from delay in the delivery of steel to the rolling mills. This condition extended over about two months and caused a temporary shut down of some of the mills. Others ran irregularly and all went behind in the fulfillment of their contracts. Dealers and consumers found it exceedingly difficult to get spot orders filled and prices again stiffened. Early in October, the sheet iron makers met at Pittsburgh and agreed upon a general advance in the price of black sheets, which was maintained with fair regularity up to the close of the year. The last quarter of the year was marked by a very decided improvement in the volume of business placed with the mills. A large number of heavy orders were entered for deliveries extending well into the first half of 1898. Moreover, the makers were able to get more profitable prices for their product. At the close of the year all the mills were busy and the makers were looking forward hopefully to an active business and better prices in the new year. The demand for light sheets in the past year was found to be relatively greater than for the heavier gauges, reaching at times very large proportions. A few of the tin plate makers took advantage of this to temporarily divert their mills from the manufacture of black plate to that of light sheet iron. This policy was not followed out to any great degree, however, although it had its effect in keeping down prices by increasing competition.

Galvanized sheets were not quite so active as black sheets, although the demand for the former reached much larger proportions last year than it did in 1896. The amount of building in which this material is used did not come up to the expectations formed for it at the outset of the year, but in other directions probably 25 per cent. more galvanized iron was used than in the previous year. During the last two months, in particular, orders were very freely placed. Several attempts have been made by the makers to advance the price of galvanized iron, but with little success. During the whole course of the year the price has been run along on a very low range with little fluctuation either way. The makers are hoping for improvement in this respect during the present year, as there is promise of a much larger consumption of galvanized iron in the building trades. The tendency of consumers to buy direct from the mills has become still more pronounced during the year. The jobbers are handling less and less sheet iron each month, and now carry very light stocks, only sufficient to supply the wants of their smaller customers. Manufacturers' agents take almost all the business in this line in all the larger centers.

Manufacturers' Reports.

We have received a number of letters from manufacturers of sheet metals, from which we select a few extracts bearing on the situation in these materials :

One of the largest concerns manufacturing iron and steel sheets in the West write as follows : We have never in our experience had a more urgent demand at the end of the season than we are now experiencing. This indicates that consumers of every class are urgently wanting material, and have comparatively small stocks from which to draw for their requirements. With this condition before us, and the prospect for a more active spring trade under the stimulating influence of a very general prosperous condition in agricultural circles, we look forward to 1898 as promising a better year's business, not only in volume, but in point of profit, than the iron trade has experienced for years. It is not likely, with the large reserve in the way of productive capacity that is represented by inadequate and idle mills, that prices will reach a boom point, but we do believe that material advances will be made in the selling price which will give a good profit to well equipped and modern factories. The condition in the raw material end of the business has shown radical improvement, and prices show strong advancing tendencies with a quickening demand. The situation as a whole is very satisfactory indeed to us.

From an important Western maker of sheet iron we get the following : The total volume of our business for the year 1897 will not be so greatly in excess of 1896, caused in some measure by the serious coal strike that prevailed, by which we were unable to run our works a part of the time full, and consequently we have not the figures yet at hand, but our impression is that the total tonnage of material made and sent out will not very much exceed that of 1896. In regard to the margin of profit, it is too early for us yet to state positively in regard to that, but we are under the impression that the margin of profit will be very small, but at the same time over and above that of the preceding year. In the matter of collections, they are much better than last year. In fact, our collections are extremely good, and our losses and bad debts are much less during the year 1897 than in the year 1896. We consider the prospects for the coming year in the volume of trade exceedingly good. We have already booked considerable business for the year 1898, and at better prices than have averaged during the year 1897, and we look for some advance in the prices of our finished material during the year 1898 over and above the present ruling prices in the market.

A Pennsylvania concern, manufacturing high grade

steel sheets, say : The business of this year, as compared with last, has been considerably more in volume, but, as to profit, little if any improvement, which is due to the present ruinous policy of the tin plate mills manufacturing and selling at a very low figure light sheets in competition with the sheet mills. Collections during this year have been very much improved over last year. For the year 1898 we think the prospects are extremely encouraging for a large volume of trade, but in our opinion prices, while possibly slightly advancing, will not reach a high level.

A manufacturer of galvanized sheet iron favors us with the following : We have done about 22 per cent. more business this year than last, at about the same percentage of profit. Collections have been better than last year, especially during October and November, but we can note but little improvement with those who were the slow fellows last year. The betterment of collections comes from quicker remittances from those who did not do badly last year. As to a higher level of prices, we cannot see where it is coming from. The purchasing capacity of the public is, we believe, but slightly improved. The burden of debt has been lifted some, but those to whom the money was due and paid are those who were able and have bought what they needed even through the hard times. The large mass of people, the agricultural classes, have had a better year of course, but they have been so badly off that their sentiment still is to wear their old clothes and use their old stove, but get out of debt first. If it will be our luck in this country to have lots of wheat to supply those who have little for a year or two longer, times might be good again.

Iron and Steel Roofing.

Sheet metal work is too broad a term and includes too many separate and distinct trades to serve as a proper subject for review. Instead of attempting therefore to make a general survey of sheet metal work we will merely touch briefly on some of the more important departments and give quotations from correspondents in roofing and cornice work, by which we mean to include makers of ceiling and sidings, conductor pipes, eave troughs, &c. The record for the year corresponds closely with the general average of all the trades. That is, as we pointed out in the brief summary on our editorial page this week, the year was to most people divided into two parts. A beginning hopeful but poor in business with a gradual awakening of trade toward the middle of the year and then considerable activity through the summer with a falling off in most cases in December. So it has been with the cornice and roofing trade. Prices also have reflected conditions prevailing in other industries, for the complaint is almost universal that the market values have ruled low, and there does not seem to be any very strong hope of an early advance.

A typical opinion is presented in the following brief extract from a letter of a correspondent who is prominent as a maker of metal roofing : Our business, especially the last part of this year, has been very much better than it was last year. Our increase has probably been 25 per cent. over last year. Prices have ruled low during the entire season, but there has been a slight improvement as compared with a year ago.

Another manufacturer in the Middle West writes : Business has been done on a smaller margin than ever before and collections have been about the same as before. We do not believe that there will be any excessive volume of business for 1898, nor will prices reach a higher level than the highest point of this year. We rather look for a scaling down in wages and materials.

We quote as follows from a letter received from a prominent Tennessee manufacturer, which shows the condition of affairs in the South : During the first half of the year business in general was very unsatisfactory and margins were very narrow. There was a perceptible improvement after July, which gradually increased until October, when it was seriously checked by the prevalence of yellow fever in different sections of the South. Business was entirely cut off in several of the centers, and directly and indirectly it affected trade all over the South, and there was no improvement until December. Since the quarantines were raised business has improved materially, but not to the extent it would have done if the price of cotton had not been so low. There seems to be only one thing in the way of a very satisfactory business during 1898, and that is the low price of cotton. We cannot tell at this time what effect this will have, but at the present time it is cutting quite a figure.

Gedge Brothers Iron Roofing Company, Anderson, Ind., take a cheerful view of the past and of the future, as indicated from the following extracts from a letter recently received : The volume of our business for this year has been much in excess of our expectations and has been greater than last year, and a very pleasing feature of it is that it is holding up much longer than usual, as ordinarily December is a very dull month, but it looks now as if it would rank as one of our very busy months. The first part of the year we did not do very much business, but in the latter part we more than made up for it, and in fact could have done still more had we not been hampered and delayed in getting steel fast enough for our wants, due to the fact that all the mills have been overcrowded with orders. This has lost us a considerable amount of trade, and of course reduces our year's business correspondingly. Prices have been very low and margins not altogether satisfactory. Yet we have done so much better than we expected at the beginning of the year that we feel we really have no cause for complaint. We think every indication is for a good business the coming year with more satisfactory margins, and we are so satisfied that business will be good that we are making our preparation accordingly.

The E. E. Souther Iron Company of St. Louis, Mo., write as follows : Business for the year has shown increasing sales both in amount and in commercial value, though the price per pound was lower than the average for 30 years ; nevertheless it is higher than for 1896, this feature being especially marked in the latter six months, though the average value of stock in store at the close of 1897 is scarcely higher than a year ago. Collections on the whole have been more prompt and satisfactory. The general aspect is more cheerful than a year ago, though we look for lower prices to prevail during the period of bad weather, say until March, owing to the scarcity of immediate demand on factories during that time. Business then, we think, will become more active due to the coming of weather for outdoor work, and all buyers and consumers will be very busy, though, as usual, a large half will be too late in putting in orders to secure timely deliveries. For the year 1898 we look for a better business than for many years before, without any mushroom boom or soda water effervescence in it.

EAVE TROUGHS, CONDUCTOR PIPES, ETC.

The following letter is from a prominent manufacturer in the East : We have found business in our line about the same as last year. We have secured a larger proportion of the business, however, so that we have had more work to do, but have reason to believe that we have merely regained customers lost in 1896, and that our increase does not come from any increase in general business in our line. The margin of profit has almost entirely disappeared in the several lines in which we deal. We should expect that the coming year would bring a large volume of business, for it seems impossible that the tremendous and profitable foreign business in breadstuffs which this country has done should continue to manifest itself in the liquidation of debts merely. We believe that it must shortly lead to commercial and industrial progress and an increase in the volume of general trade.

A maker in the Central West writes us as follows : The volume of our business has been very much greater than last year, but we judge not because of a greatly increased consumption of goods. It is rather due to this : Prices have thus far been so unsatisfactory that many makers withdraw from the market, so that what goods were made were made by a less number of manufacturers than before, consequently swelling their production. Profit on our goods through overproduction has been brought down to nothing, and the future does not hold out any very great encouragement, though we do look for a larger volume of business.

A Western manufacturer writes as follows : Our business has been unexpectedly good, especially this fall. We disposed of nearly three times as many goods in the last six months as we did in the last half of 1896. Collections are considerably better and there were but very few failures on the part of our customers. On account of the wheat crop and good prices of wheat we expect to very nearly double our business the coming season.

The Wilmington Cornice Works, Wilmington, Del., write : We have found business this year a great deal better than in 1896, and our margin of profit has been better also. Our collections have been much quicker and, in fact, 1897 has been a great improvement over any of the preceding four years, and we feel sure that the coming year will surpass this and prices are bound to reach a higher level.

The following interesting letter is received from the Moncrief-Dowman Company, Atlanta, Ga.: We found business this year to be about the same as it was in 1896, possibly a few thousands of dollars larger in volume. Of

course the margin of profit has not been quite so large on some goods, for as time progresses competition increases and where there is much competition the profits are less. However, up to the present time we are well pleased with the year's trade. Of course we cannot tell much about the prices that will prevail during the coming year, but we hope that they will increase all along the line in our classes of material, especially in the metal line. The outlook at this time for business is very promising, especially in this section of the country. In our city there has been more building than in any previous years, leaving out the exposition buildings, which were erected during 1895, and we look for many improvements in our territory, which embraces three or four of the Southern States. We have found our collections this year to be fairly good, and while we expect an increase in business for another year we do not anticipate any material advance in prices.

A prominent roofing and cornice concern in Minneapolis write: We have found business during the year slightly increased in volume over the preceding year, but the margin of profit has been sensibly decreased, owing to local conditions rather than general close figuring. We consider the prospects for the coming year to be very much better than for some years past, and believe work in our line is gradually on an increase on the better class of buildings.

We have the following letter from the J. A. Ritzler Cornice & Ornament Company, Kansas City, Mo.: We have done about double the amount of business this year as compared with last. The margin of profit, however, has been quite as small, if not smaller, than a year ago, and there is no opportunity yet for an advance. The prospects for the coming year are bright and we believe it will be a great season, providing the crops do not fail. This is particularly necessary to prosperity in this section of the country.

FLASHINGS.

We have received from the Allen Anti-Rust Mfg. Company, Cincinnati, Ohio, a circular entitled "Does Your Roof Leak?" and dwelling on their method of prolonging the life of an old roof at small expense. The circular is in the form of a folder, containing 20 pages, showing some large buildings in which Allen Anti-Rust Japan has been used for coating roofs and other exposed portions of the building with satisfaction to all concerned.

The Wais & Roos Punch & Shear Company, Cincinnati, Ohio, are now sole manufacturers of the Heckney Pneumatic Power Hammer, formerly built at Cleveland.

Among some large contracts recently taken by Moncrief-Dowman Company, Atlanta, Ga., are the Metal Work for several large schools, and also the large railway shop of the Western Railroad of Alabama at Montgomery.

The Wilmington Cornice Works, Wilmington, Del., last spring moved into new quarters at Eleventh and West streets, which gave them over 2000 feet more floor space. They find, however, that this is not sufficient for their growing business, and intend to add about 2400 more feet this winter.

The Wheeling Corrugating Company, T. H. Jones, manager, have removed their Western salesroom from Laflin street to a fine location at 185 and 187 Lake street, Chicago. They have secured a large room, 40 x 100 feet, on the ground floor, with a good basement below it, and will carry a stock of Sheet Steel Ceiling, Roofing Material, Galvanized Iron, Tin Plate and Tinners' Supplies generally. The new quarters are in the immediate vicinity of other houses handling similar materials and dealing with the same trade.

The catalogue of Peden & Co., dealers in Tinners' Supplies, Roofing Materials, &c., Houston, Texas, is a pamphlet measuring 9½ x 12 inches in size, containing 64 pages and illustrating and pricing a great variety of goods, including Sheet and Pig Metals, Eave Troughs, Conductor Pipes, Stove Pipe, Thimbles, Collars, Tinners' Trimmings, Roofing, Corrugated Iron, Metal Shingles, Weather Boarding, Steel Ceilings, Paints, &c. The latter part is taken up with Nails, Wire, Tinners' Tools and Machines, Crestings, &c.

We are indebted to the Clayton & Lambert Mfg. Company, Ypsilanti, Mich., for a copy of their catalogue devoted to Gasoline Fires and Hose Fittings. Gasoline Furnaces for tinners and plumbers are shown in several sizes; likewise Brazing Fires, Painters' Torches, Electricians' Fire Pots, &c., the latter part of the catalogue being given up to Hose Fittings, which are thoroughly illustrated and described. A smaller circular, printed in different colored inks, emphasizes the merits of the Fire Pots in a way to attract attention.

A catalogue of the La Crosse Steel Roofing & Corrugating Company, La Crosse, Wis., is a volume of 80 pages, bound in colored paper, containing many illustrations, with descriptions of the extensive line of Roofing Supplies made by this concern. The subjects noted in the catalogue include Eave Troughs, Gutters, Hangers, Troughs, Elbows, Conductor Hooks, Leader Pipes, Ventilators, Cresting Blocks, Ridgings, Window Caps, Moldings, Cornices, Weather Vanes, Steel Siding and Ceilings, Iron Shutters, &c. Other goods carried in stock include Tin Plates, Sheet Metals, Paints, Tinners' Tools, &c.

Catalogues A, B and C, issued by the Thompson Mfg. Company, Cleveland, Ohio, present very fully the extensive assortment of goods made and carried by this firm. Catalogue A, a volume 8 x 5½ inches in size, contains nearly 100 pages, and is devoted to Corrugated Sheets, Steel Roofing, Siding, &c. Catalogue B is of somewhat larger size, and refers to Galvanized Cornices, Skylights, &c., while Catalogue C, a pamphlet 11½ x 8½ inches in size, contains 40 pages, and is issued in the interest of Metal Ceilings, Side Walls, &c. The latter is given up principally to fine illustrations showing the designs in which these metal goods are made. In all cases the engravings are accompanied by brief descriptive text and price-lists.

We quote as follows from a letter from John A. Walker, vice president of the Joseph Dixon Crucible Company, Jersey City, N. J., reviewing the business situation: "In 1893 it was a case of business paralysis, in 1894 we had a year of debility, in 1895 the patient partially revived, in 1896 came a relapse, but in 1897 came recovery and the patient took up his bed and walked. The great medicine man was $1 wheat and 30-cent corn, plus poor harvests at this exigency abroad. I saw it myself, for in November I visited Indianapolis, Cincinnati, Chicago, Omaha, Denver, Kansas City, Pueblo and St. Louis, and saw every one up to his eyes in new business. The consumer at last had money once more, and was spending it."

The Russian American Trading Company, who have just been chartered under the laws of the State of West Virginia, with a capital stock of $5,000,000, propose to open stores and warehouses in St. Petersburgh, Moscow, Warsaw, Odessa, Samarkand, Omsk and Vladivostock, and to establish agencies throughout European and Asiatic Russia for the purpose of handling all classes of American manufactured products. Their efforts will, however, be chiefly devoted to the line of machinery. It is stated that they will have a competent staff of engineers in every branch, in order to enable them to take contracts for the construction of electric car lines, power and light plants, cold storage warehouses, ice factories, &c. They also propose to operate steamship lines between New York and Baltic seaports, as well as between the Pacific coast and Siberia. Among the projects of the new company is one to hold a large exposition of American manufactures and products in Moscow during 1899. The head office of the company in this country is in the Corn Exchange Bank Building, New York City.

It is reported that Japanese engineers are preparing plans for the construction of a bridge across the Straits of Shimonoseki, so as to unite the main line of the Kin Sun Railway with that of the Sanyo Railway from Shimonoseki to Hiogo. The straits, at the point referred to, are about one mile in width, and the current through them is very rapid. The bridge, moreover, must be constructed sufficiently high to enable the largest ocean steamers to pass beneath. Thus, the undertaking, if successfully carried out, would be one of the greatest engineering feats of its kind. Should the work be undertaken, it is probable that its construction will throw a large amount of business in iron structural to foreign firms. The work of construction, however, will be undertaken and supervised by Japanese engineers exclusively.

Advices from San Francisco, Cal., state that there is a famine of cargo vessels at that port for the Australian trade. Last week there were no less than three full cargoes awaiting shipment at San Francisco to Sydney, Melbourne and Adelaide, and no ship could be procured to take them over. A number of vessel owners, who have unappropriated ships, are preferring to hold them for the heavy Klondike trade expected in the early spring.

A charter has been applied for by the Kansas City, Lawrence & Topeka Electrical Railway and Power Company, with a capital of $3,000,000. It is the intention of the promoters of the enterprise to construct an electric line between Kansas City, Mo., and Topeka, Kan., to do a freight and passenger business. They contemplate using water power from two dams, one at Lawrence and one near Holliday, to generate the electricity.

The mine owners of the Ishpeming, Mich., region have decided to increase the miners' wages 10 per cent.

TIN PLATES.

Tin Plates in 1897.

A year ago, in our review of the tin plate trade of the United States for 1896, the remark was made that the year had witnessed a complete revolution in the trade, in that the American manufacturers of tin plate had virtually monopolized the home market, with the exception of the Pacific Coast and that proportion of the consumption represented by the exporting oil and canned goods interests. During the year just closed another important step forward has been taken, and one part of the reservation then made may now be omitted. For the Pacific Coast trade, too, has dropped into the hands of the domestic tin plate makers. Only the consumption represented by the packers of goods for export remains, by virtue of the rebate allowance of 99 per cent., for the present out of reach of the American manufacturers.

So complete has been the conquest of the domestic market that to-day American plates are selling on the Atlantic seaboard 75 to 80 cents a box below the price at which Welsh plates of corresponding grades can be laid down, while the importations of foreign tin plate are confined almost exclusively to material brought in to be made up into packages and re-exported. All sizes, gauges and qualities of bright and roofing plates are now being produced by the American mills, so that there is no longer any inducement for consumers to go abroad for any of the material they may require in this line. The Welsh makers have finally recognized the inevitable and have now parted with the last lingering hopes they may have harbored of the reconquest of the American market. One of the most remarkable triumphs in the commercial history of this country has thus been won by the latest of American industries. Its definite consummation was reached in the year just ended, and 1897 must therefore take a front rank in the annals of the tin plate industry.

Increased Output.

The past year was also a notable one from the fact that it was marked by the most prodigious growth in the producing capacity of the American mills as yet recorded for any year in the history of the industry. The number of new hot mills completed or begun during 1897 was no less than 100, or about 55 per cent. over the total number recorded a year ago. This is a remarkable showing in itself, and yet it does not represent the full measure of progress accomplished. The growth in the productive capacity of the industry by the building of new mills has been further supplemented by the fact that most of the mills in existence a year ago have been steadily increasing their capacity by the introduction of improved methods and by the greater skill and efficiency which have come to the workmen with time and experience, so that the rated output of a tin mill has increased materially—possibly as much as 10 or 15 per cent. This is a fact to be reckoned with in any estimate of production and consumption. It is a feature which gives the mills in this country a decided advantage over those of Wales, where the output of a tin mill per turn is limited by the action of the men's union to 36 or 40 boxes. Here an output of 50 to 60 boxes a turn is common and the proportion is steadily growing. This forms an important factor in reducing the cost of manufacture. The advantage thus secured will tell in the future when the time arrives—as it is bound to do—for the competition of American plates with the Welsh product in the markets of the world.

Condition of Business.

In a review of the American tin plate trade during the past year several interesting features present themselves. A year ago the domestic manufacturers had to report a season of sharp disappointment both in the volume of business and in the prices at which their product was sold. The canning trade had gone through a year of pronounced depression, building operations had been conducted on a very limited scale and the tinware factories had reduced their output materially. Consequently the demand for all varieties of tin and terne plate had fallen far short of expectations. The mills had been running irregularly and the business altogether had been unsatisfactory. During 1897 these conditions underwent a radical change. Although the demand in the early part of the year continued on a moderate scale, the gradual improvement which was developed in the general business of the country as the year progressed began to have its effect in more liberal orders for tin plates, particularly from the canning trade. In the spring some large orders were placed with the mills for coke plates for progressive delivery, which carried them along comfortably to the middle of the year.

The Wage Scale.

At the approach of July 1, when the annual wage scale was to be settled, it was feared that trouble would be had with the tin plate workers in coming to a settlement of the question. The mills were all closed down on July 1 and the trade were prepared for a strike involving a more or less prolonged suspension of operations. The employers, however, settled the matter with the Amalgamated Association within a few days, on the basis of an advance in wages ranging from about 8 per cent. for rolling to 12 and 15 per cent. for heating and shearing. The new scale was signed and most of the tin plate mills were running again by the second week of July. After that time the only impediment to their activity was a pronounced scarcity of steel, which arose in the fall and hampered the mills to a serious degree. This inconvenience, which extended well into the month of November, was caused primarily by a strike in the coal trade which affected the steel mills. But the complaint was also made at the time that the steel makers had been favoring their larger customers for bars and billets to the neglect of the tin plate makers. Although the latter were forced to delay deliveries on contracts, the stringency was not as seriously felt in the tin plate trade as it might have been, for the demand for spot plates fell off materially in the last months of the year. Stocks, however, remained very light, and orders for prompt shipment could not be filled except at a sharp advance over the current rates. The year closed with practically the entire tin plate manufacturing industry in full and steady operation, many of the mills having full order books for several months ahead, while available

stocks of plates alike in makers', dealers' and consumers' hands were remarkably small.

Consumption and Prices.

Looking over reports we have received from a large number of tin plate manufacturers and dealers in all parts of the country, we gather that the increase in the volume of business done in American plates in 1897 was on an average about 25 per cent. over that of the previous years. To that extent, therefore, the past year was an improvement over the two or three preceding. Unfortunately, the gain in the amount of product put into consumption was offset by the low prices which prevailed almost throughout the entire year. Notwithstanding the efforts made by the manufacturers to hold them up, backed up as they were by many of the leading jobbing houses, tin plates alone failed to share in the improvement which was developed in almost all lines of metals in the second half of the year. On this subject the views of members of the trade which we print elsewhere will be found interesting.

The consumption of tin plates during the year kept pace about evenly with the increase in production. That is, it expanded about 25 per cent. above 1896. As the imports were applied almost wholly to the manufacture of packages for export, the American production for the year would represent about the amount actually used for domestic purposes.

What the total production of the American mills in 1897 was it is not possible to ascertain to a certainty. But that it far exceeded that of 1896 is certain. The last official figures published by Special Treasury Agent Ayer, covering the fiscal year ended June 30, 1896, placed the production of tin and terne plates for that period at 307,228,621 pounds. The official figures for the last fiscal year have not been yet published. But a careful and conservative estimate, based upon good information, would indicate that the output of the American works in the year ended June 30, 1897, reached at least 425,000,000 to 440,000,000 pounds, or between 40 and 45 per cent. increase over the previous fiscal year. As the mills, as a whole, were steadily employed in the last half of the year the proportion of output was probably raised so as to bring the total for the calendar year 1897 up to at least 500,000,000 pounds.

Association of Makers.

In the spring of 1897 a movement was started for the organization of a new association of American tin plate makers to take the place of the old Tin Plate Manufacturers' Association of the United States, which for several reasons was thought to have outlived its usefulness. The movement was fostered by several of the largest tin plate concerns and represented the more modern and progressive element in the industry. Its object was declared to be to bring the various manufacturers together for the discussion of plans looking to their mutual benefit and to place the trade on a profitable basis by means of an amicable agreement whereby the severe cutting of prices that had prevailed might be mitigated. A number of meetings were held during the spring and early summer at Pittsburgh, Chicago, Cleveland and Columbus, Ohio, and a temporary organization was effected under the title of the Tin Plate Makers' Association of the United States. A schedule of base prices was drawn up and adopted in the form of a "gentlemen's agreement" without penalties being attached for their infraction. This agreement was adhered to more or less closely for a few months, but suffered the usual fate of such agreements when the summer dullness in the trade moved some of the mills who wanted orders to begin cutting their prices again.

Nevertheless, the organization of the makers survived as a basis for future concerted action, and the old association dropped out of existence. This week the tin plate makers have again met, and it is rumored that a new effort will be made to regulate the selling price of American plates, so as to bring them up to a more profitable level.

The New Tariff.

After a long discussion the new tariff act, known as the Dingley bill, was passed into law on July 24. By its provisions the duty on imported tin plate was raised from 1 2-10 cents a pound under the Wilson-Gorman law to 1½ cents a pound. An effort to cancel the drawback allowance of 99 per cent. on re-exported plates was defeated, and that clause was continued in the new bill. The changed tariff had little or no effect on the tin plate trade, as American plates, even before its passage, were already underselling the Welsh product on the coast by about 35 to 40 cents a box, while the importation of foreign plates was confined to a few specialties and the plates used by the exporting packers. Soon after the inauguration of the Dingley law it was announced that the Welsh owners of the celebrated M F brand of terne plates had decided to discontinue their manufacture abroad and to make them exclusively in this country.

Roofing Plates.

A feature of the trade last year was a marked falling off in the consumption of roofing ternes. The decline in this line is estimated at from 40 to 50 per cent., as compared with the average of former years. Various reasons are given for the same, none of which are flattering to the hope of an early expansion in the demand for these plates for roofing purposes. It is generally claimed that other materials, such as wood and metal shingles, galvanized iron, copper and slate, were used last year on the roofs of many buildings in which tin would usually have been employed. Whether this neglect of terne plates is only a passing fancy or whether it is a permanent change is not definitely understood by the trade. Its effect upon the dipping works, however, which have made a specialty of terne plates has been very marked.

American Base Box.

During the summer the American Tin Plate Company, the largest concern in the industry, sent out circulars to the manufacturers and dealers containing a proposal for a change in the method of packing and describing tin plates through the adoption on January 1, 1898, of a new standard American base box to supersede the old English system. The project drew forth many comments pro and con from the trade, and the preponderance of opinion seemed to be against any change of the kind at present. Nevertheless, the American Tin Plate Company took the bull by the horns, got up a ratio book and in December sent out circulars stating that they would themselves adopt the new system from January 1. In this action they have the support of some of the most prominent dealers and consumers, although the trade at large have not yet signified their willingness to adopt the American base box as their standard.

Progress of the American Industry.

The regular quarterly list of American tin plate works presented in this issue shows at a glance the remarkable strides that have been made by the industry during the past year. On December 31, 1897, there were 42 tin plate works with 223 finished hot mills under the control of 40 separate firms established and in operation or ready to operate, as against 39 works with 186 finished hot mills on December 31, 1896. In addition five new plants are building, with an aggregate of 46 hot mills, and six plants are between them adding 22 more hot mills to their capacity. At the end of last year only three works were adding five new hot mills to the aggregate capacity of the industry. The total effective hot mills in existence at the present time is 223, which, with 68 more in course of erection, gives a total capacity built and building of 291 mills in the American tin plate industry, a gain of exactly 100 for the year.

The greatest advance was made in the last quarter of the year, 12 mills having been completed, and the con-

struction of no less than 78 new mills having been begun. Among the latter is embraced what will be the largest tin plate plant in the world, the 30-mill works of the Shenango Tin Plate Company of New Castle, Pa. Works were also started in two other new tin plate plants—namely, those of the Neshannock Sheet & Tin Plate Company, New Castle, Pa., with four mills, and the two-mill plant of the Johnstown Tin Plate Company, Johnstown, Pa. Besides these the National Tin Plate Company's new eight-mill works, at Monessen, Pa., and the two-mill plant of Hamilton & Co., at West Newton, Pa., are making rapid progress toward completion.

CHANGES OF THE YEAR.

Comparing the lists of tin plate works given herewith with the lists printed in *The Metal Worker* a year ago it will be seen that the changes among the concerns coming under the head of "Tin Plate Mills" have been both numerous and important. Although no concerns have actually dropped out of existence, two, while remaining separate works, have been absorbed into other concerns, and one plant has passed into new hands. Six new names have been added to the list, making 43 separate concerns with 46 plants at the end of 1897, as compared with 39 firms and the same number of plants at the end of 1896.

NEW MILLS.

A large number of the tin plate works have added to their capacity during the year just closed by building more hot mills. These additions are as follows:

	Hot mills.
Ætna-Standard Iron & Steel Company, Bridgeport, Ohio...	2
American Tin Plate Company, Elwood and Montpelier, Ind.	6
Beaver Tin Plate Company, Lisbon, Ohio.....	2
Crescent Sheet & Tin Plate Company, Cincinnati, Ohio	2
Cumberland Steel & Tin Plate Company, Cumberland, Md.	1
Ellwood Tin Plate Company, Ellwood City, Pa.....	1
Falcon Tin Plate & Sheet Company, Niles, Ohio.....	2
La Belle Iron Works, Wheeling, W. Va.....	6
Laughlin Nail Company, Martin's Ferry, Ohio	1
Licking Rolling Mill Company, Covington, Ky.....	1
Marshall Brothers Company, Philadelphia, Pa	2
New Castle Steel & Tin Plate Company, New Castle, Pa....	2
Pittsburgh Tin Plate Works, New Kensington, Pa.....	3
Washington Steel & Tin Plate Mills, Washington, Pa.....	1
Total.....	32

In addition, the construction of new hot mills was begun at the following works:

	Hot mills.
Atlanta Steel & Tin Plate Company, Atlanta, Ind.....	3
Cincinnati Rolling Mill & Tin Plate Company, Cincinnati, Ohio.....	1
Laughlin Nail Company, Martin's Ferry, Ohio.....	8
Monongahela Tin Plate Company, Pittsburgh, Pa	5
Pennsylvania Tin Plate Company, New Kensington, Pa....	2
United States Iron & Tin Plate Mfg. Company, Demmler, Pa.....	3
Total.....	22

NEW PLANTS.

Two new black plate plants were completed and put in operation during 1897, namely:

	Hot mills.
Cincinnati Rolling Mill & Tin Plate Company, Cincinnati, Ohio.....	3
Zug & Co., Limited, Pittsburgh, Pa.....	2
Total.....	5

Moreover, work has been begun during the year on the erection of five new black plate plants in Pennsylvania, and the names of the companies formed to operate them have been added to our lists. They are the following:

	Hot mills.
Hamilton & Co., West Newton, Pa.....	2
Johnstown Tin Plate Company, Johnstown, Pa.....	2
National Tin Plate Company, Monessen, Pa.....	8
Neshannock Sheet & Tin Plate Company, New Castle, Pa..	4
Shenango Tin Plate Company, New Castle, Pa.....	30
Total.....	46

CHANGES IN MILLS.

The American tin plate company of Elwood, Ind., purchased the four-mill plant of the Montpelier Sheet & Tin Plate Company, Montpelier, Ind., which went into the hands of receivers, and are operating it under their own name in connection with their Elwood works.

The two-mill plant of the Stickney Iron Company, Baltimore, Md., which was built three years ago, but was never operated, has been acquired on a long lease by the Humbert Tin Plate Company of Connellsville, Pa., and is being run under their name.

The Monongahela Tin Plate Company of Pittsburgh, Pa., who made only black plate, have absorbed the dipping plant of the Duquesne Tin Plate Company in that city, and the name of the latter concern has been removed from our list.

The Baltimore Steel, Iron & Tin Plate Company's four-mill plant at Locust Point, Baltimore, Md., which went into receivers' hands, was purchased by a newly organized company, who have improved it and are operating the works under the title of the Baltimore Tin Plate Company.

The Britton Rolling Mill Company, Cleveland, Ohio, have added a tinning department to their black plate plant.

The title of the Connellsville Sheet & Tin Plate Company, South Connellsville, Pa., has been changed to the Humbert Tin Plate Company.

DIPPING WORKS.

Among the dipping plants few changes have been made in our list during the year. The Duquesne Tin Plate Works, Pittsburgh, Pa., disappeared by absorption into the Monongahela Tin Plate Company, while Gummey, McFarland & Co. of Philadelphia have ceased to manufacture tin plate and have been dropped from our list. Otherwise these concerns remain much as they were a year ago. A few have added to their capacity, but the total number of tinning sets shown, 164, reveals a falling off of two as compared with 1896.

These plants, which purchase their black plate and coat and finish it for the market, have been running, as a rule, very irregularly in the past year. Some few which make special plates, such as high grade roofing ternes, the reputation of which is established and for which there is a steady demand, have been enabled to keep fairly busy. But the majority of these firms who manufacture for the market have not operated to anything like their capacity. Some have run only at intervals and others have been closed down all or most of the time. The close margin at which the ordinary qualities of tin and terne plate have been selling by the manufacturers who roll their own black plate has made the dipping business unprofitable, so far as the cheaper kind of plates are concerned. Where these dipping plants are located close to a black plate mill, whose product they use under a special arrangement with the rolling mill concern, the business may probably be carred on at a profit. But in the cases where they are situated at a distance from the source of supply of black plate, and have to pay the freight on their material, they are placed at so much of a disadvantage with the black plate works coating their own plate that it must be difficult for them to manufacture profitably, except, as we have said, special plates which have made a name for themselves and which command high prices.

The Outlook.

The accessions which are now under way will, during 1898, increase the producing capacity of the American mills to a very great extent. As the present capacity of the industry, if all actively employed, would be fully equal to the entire consumption of tin plates in a year of average prosperity, the question uppermost in the minds of the trade is what the effect of the enormous expansion which will take place this year will be. In the words of one of the largest manufacturers, it means the "survival of the fittest." In other words, the larger and better equipped works will get along and those less strong will go to the wall. However that may be, the fact remains

that the production of tin plate in this country must before long outrun the consumption, unless a very radical expansion in the consumption is developed. Of this there is no satisfactory indication. While the year just opened promises to be one of good business, and an increase in the demand for tin plate is looked for, there is no reason to suppose that its volume will reach such extraordinary proportions as would absorb anything like the 8,500,000 boxes which would about represent the capacity of 291 mills. The matter is one that is agitating the minds of the trade exceedingly, and it undoubtedly tends to keep the prices of tin plate down at the low level in which they are now moving. At the same time, it should be borne in mind that by far the larger portion of the new mills will not be completed in time to figure in the market before the second half of the year. Meanwhile, the existing mills will probably experience a good demand to keep them busy for the greater part of the year. Whether the prices at which they sell their product will be equally satisfactory is another matter and one which is not regarded with complete equanimity by either the manufacturers or the jobbers.

Tin Plate Machinery.

With the large additions which have been made to the American tin plate industry during the past year, and those now in progress, 1897 has been a year of marked prosperity for the manufacturers of tin plate machinery. Several new concerns have embarked in this line of manufacture and the business has grown to be one of considerable importance. A number of foundry and machine firms, which have been in existence for years producing other lines of work, are now devoting themselves exclusively to the production of tin plate and tinning machinery, which they find more profitable than their former business. Some notable improvements have been made in this department during the year, the tendency to adopt more efficient methods and labor saving apparatus having led to a number of inventions connected with tin plate manufacture. The outlook in this trade is regarded as very favorable for 1898, many of the concerns in the business having enough work on their books to keep them busy for several months to come, while the inquiries lately received point to the probability of a considerable number of new orders being placed in the near future.

Manufacturers' Reports.

With the view of giving our readers a comprehensive idea of the present position and future prospects of the American tin plate industry, as they present themselves to those intimately engaged in it, we give the following extracts from some of a mass of letters we have received from concerns engaged in the manufacture of tin plate in different sections:

A Pennsylvania rolling mill engaged in the manufacture of both black and tin plate for the market write: In regard to the business for the year, we have been very busy on orders for all our present facilities, but at extreme low prices, and we think the volume has been large, but not remunerative, and the American mills, with their increased output, have been able to supply the American market outside of the export trade, which, of course, is still imported. The prospects for the coming year look bright for a large business, but whether it will be remunerative is hard to tell. But if there is general prosperity it should increase the demand so as to give us a much better chance to handle the business on a profitable basis.

Another manufacturing concern in the Pittsburgh district express themselves as follows: With reference to business of the past year, we have had all we could do, but, as you are aware, prices are very low, and much lower than we anticipated a year ago. We have now gotten to a point where competition is a serious matter, and we are not sure that the bottom has yet been reached. The large additions now being made to increase the capacity of the tin plate mills in America are unquestionably the cause for the depressed condition of prices. It looks very much now as though domestic production might be greater next year than the consupmtion. We know of no business which has grown so rapidly in such a short time as the tin plate industry, and we are not at all pleased with the future outlook.

In the same district one of the smaller mills report their "business much better than last year; good prospects for 1898." They are in receipt of a large number of inquiries.

A similar tale is told in the following letter from a large mill in Pennsylvania: We have had a larger volume of business this year than in the previous year, but have found that competition has been keener than ever before and prices lower than at any time previous, irrespective of the fact that raw material may have been higher at times. We believe that there will be considerable tin plate trade during the coming year; but we also believe that the competition will be worse than ever heretofore. In regard to the additions now being made, and others which are on paper, our idea is that the tin business will be to a certain extent demoralized, and that it will mean a "survival of the fittest." Small mills or tin mills who have not got substantial backing are liable to be crushed out of existence. As regards the matter of production, this country already does or can produce about 15 per cent. more, according to the best available statistics, than the country itself consumes, and it seems this fact of over production will be still further increased with the new tin mills now building. The matter of competition and over production has consequently kept the price of tin at a figure when sold to the jobbers which scarcely more than pays the cost of production, whereas a fair price might be secured if the production was somewhat less than the consumption, as the lowest price which English plates can be imported at would leave the American manufacturer a nice margin for his goods if sold at the same price.

A large mill in Ohio furnish us with the following report: We have been fully occupied during the entire year, and it has been a very satisfactory one on the whole to us, although prices have ruled rather low and competition has been keen. We think that the tin plate trade for 1898 promises to be very good, and we will not be surprised to find it to be the banner year for tin plate consumption. In our opinion the large additions now being made to the tin plate producing capacity will not have any effect on the trade before late in 1898, if then; the effect will be to lower prices so that the business of reexport plates will be secured by the American makers. This will give work to all the new mills and more, too, so that we feel all the tin mills will be fully employed for some years to come. We think the American production will in time outrun the home consumption, but by this time we will be exporting tin plates to the markets of the world. There has been a large American production this year, and it will be much greater next year; but if business continues to improve, as present conditions indicate it will, the consumption will take up more than the American product.

An Indiana gas belt mill write as follows: The volume of our business for this year was about the same as last. We have noticed no appreciable increase, and prices grow weaker as time advances regardless of higher priced steel, labor, &c. This condition is undoubtedly due to the excessive competition on the part of home manufacturers, which is accentuated by the fact that the supply is in excess of the demand at certain seasons of the year, and the anxiety on the part of sellers at such periods results in the lowering of prices to a point where only the best managed and well regulated mill can make plates at a profit. On the completion of the mills now under course of construction the supply of tin plate will be far in excess of the demand as far as the home market is concerned, and the only salvation for American manufacturers to secure enough business to go round will be in the capturing of the export trade which is at present enjoyed by the Welsh manufacturer. The only way in which this can be accomplished will be by a reduction in the price of wages governed by the Amalgamated Association. This, we think, could be brought about amicably if the workmen would concede the necessary reduction on this part of the business alone, amounting possibly to 1,000,000 to 1,500,000 boxes. The failure on their part to do this means the breaking down sooner or later of the established price now prevailing in its entirety.

Jobbers' Opinions.

A number of jobbing houses in various sections have favored us with their views in regard to the tin plate trade. From among these reports the following interesting extracts are presented:

A Chicago house doing a large business in tin plate say: The last year's business has been rather unsatisfactory from a standpoint of the mills. As commission merchants we have handled a large volume of tin plates, and our margin of profit is only slightly reduced by the reduc-

tion in priecs, and so our business has been of very satisfactory nature. We think, however, that all of the makers of tin plate are dissatisfied with the trade as it has gone during past year and feel that some strong measures should be taken to put the business on a better footing. There is no reason why the tin plate makers should continue to make cutthroat prices, and the large buyers of tin plate all agree that uniform prices, even though they be materially advanced over those now ruling, would be much more desirable. The outlook for next year is promising as far as volume is concerned, but prices are being made that must necessarily show small profit to makers. The present indications are that heavy consumption of tin plate will take place during the coming year, because the probable vegetable and fruit pack will be considerably larger than during the past year.

A Southern firm of tin plate jobbers write as follows: Our business for 1897 has been satisfactory, and larger than that of 1896. The South, generally, has had a number of adverse conditions to contend against, notably the high water in the spring, the fever in the summer and fall, and the very low price for its staple product, cotton. Notwithstanding all of these, we have no complaints to offer, and have heard of none of a general and serious nature. We believe the prospects for 1898 are good, but as regards a higher level of prices we regret to say that we do not look for any such desirable condition, and can see nothing in the future to bring it about.

A large Western jobbing house handling tin plates write as follows: Our trade on tin plate for 1897 has been very largely in excess of 1896. Competition naturally seems to grow harder and more severe. We are somewhat loth to express any opinion as to the future of the trade, having in mind the fate which awaits most prophets, but if we may judge from the history of most too highly protected industries it is a fairly safe proposition that the domestic production is likely, sooner or later, to outrun the demand, and consequently to bring down the average price of tin plate to a lower level than has ever been known in this country.

The following report comes from a firm on the Pacific Coast: Until this last year the greater portion of the tin plate used on the Pacific Coast has been of foreign production, but at the present time the trade generally have swung around into the use of American tin plate, and it now looks as if the trade would continue to use plate from the American mills continuously in the future. The change in use from foreign to domestic plate has been brought about very largely by the action of the railroads in reducing the rate of freight on the article 33⅓ per cent.

A Baltimore house report that their tin plate business has been very much better than for the past two years, although prices have been lower than they should have been had dealers been alive to their interests.

An Eastern concern dealing largely in tin and terne plate give the following report: We are pleased to state that our sales of roofing plate have largely increased over last year's output. The selling prices both to the trade as well as to the consumer are being constantly made with closer margins for the manufacturer as well as the middleman. This is a natural result of increase of output. The producing capacity of the American mills is assuming enormous proportions. We are pleased to state, however, that the attention of the manufacturers has been recently directed more to the production of the higher grade roofing plates. In fact, if any profit is made in 1898 by the manufacturers of roofing plate, those mills making the largest percentage of special brands will undoubtedly be the only ones that will report at the close of the year a balance on the credit side. The cheapest grades have reached the minimum quality, as any injudicious economy attempted by any manufacturer in lessening the quantity or quality of coating would tend to throw trade most positively and directly toward higher grade plates. The architects in our vicinity are almost vying with each other in their specifications, and are exerting every effort to induce dealers to use high grade plates. You will undoubtedly note a general closing of the low grade roofing plate concerns, or at least frequent stoppages " for repairs " between January 1 and September 1.

A large hardware concern in the Southwest give the following report : Since the settlement of the financial question last fall business has had a much better tone and strength. An improvement commenced at once, but during the winter succeeding, the volume was only slightly increased, compared with the same season of the two preceding years. It has constantly improved during the spring, summer and fall, and our business is 25 per cent. greater than that of 1895 and 1896. Competition is very active, but prices have been fairly well maintained. We consider the prospect for sales of roofing plate very good for the coming year. That of the bright plate is not so good in this section, owing to the low prices of tinware sold by the large factories. We anticipate a prosperous business for 1898, and with the average condition of agriculture we know of no reason why, with the present general feeling of security about money matters, we should not have a successful business.

A Texas jobbing house dealing largely in tin plate state that their sales last year compared very favorably with former years, in spite of yellow fever and low prices for cotton. They expect a still better trade in 1898, especially in the line of roofing plates.

MEETING OF TIN PLATE MAKERS.

An important and well attended meeting of tin plate makers was held on Wednesday and Thursday of this week at Columbus, Ohio. Matters of considerable importance are reported to have been under discussion, but up to the time of going to press no details in regard to the results of the conference had transpired. It is understood that among the subjects considered was a request from the jobbers that the cash discount be made 2 per cent. instead of 1 per cent. as now, as well as a request of the National Hardware Association to have the time on which tin plate is bought extended from 30 to 60 days. The new American base box system was also a subject of interested discussion. The new system introduced by the American Tin Plate Company is much talked of in the trade, and opinions as to the desirability of its adoption differ widely. In Chicago one of the largest jobbing houses announce that they will adopt it at once, while the others are uncertain what they will do in the matter. Some of the New York jobbers are favorable to the plan, but most of them are inclined to wait until the trade are educated to it before adopting it themselves. In view of the low prices ruling for tin plate, especially for Cokes, it is thought probable that an effort will be made to reorganize the Tin Plate Association with the view of keeping prices on a more profitable basis.

SCRAP.

The advertisement in the present issue of the house of N. & G. Taylor Company, Philadelphia, is their eighty-ninth annual greeting to the trade. As one of the oldest houses in their line and as one of the early advertisers in *The Metal Worker* it affords us pleasure to commend to our friends this old established Tin Plate house, now closely bordering on their ninetieth year of existence. Established in Philadelphia away back in 1810, by the grandparents of the present members, when the city covered only a few square miles, this firm have grown in proportion with the growth of the city of their birth. Their agencies now extend to almost every city in the United States, and their Taylor Old Style brand of Roofing Tin is handled by leading jobbers throughout the country.

We are advised by L. L. Abbott & Co., 136 Liberty street, New York, agents for the M F Roofing Plate, that they are in receipt of a very heavy demand for their Plates. The M F plant, at the Ellwood Tin Plate Company's works, Ellwood City, Pa., is running night and day in all departments to keep pace with orders. The quality of the American made M F Ternes is declared by all those who have tried them to be fully equal to that of the same Plates when they were made in and imported from Wales. This bears out the statement of the owners that the Plates made in this country and sold under the well-known brand would be in all respects identical with those manufactured and sold by them on the other side for over 50 years past. An absolute guarantee of quality is given with each box of M F Terne.

The 1898 calendar which the well-known Tin Plate and Metal house of Bruce & Cook, New York City, are sending out this year is of the familiar pattern which has greeted their friends for many years past. It consists of a large sized card for hanging, in the center of which are given exterior views of their premises at 186-190 Water street and 248 and 250 Pearl street. On either side of the illustrations are placed tables of the months, while above and below are lists of the goods dealt in by the firm. The present calendar, which marks the eighty-sixth year of the firm, is printed in dark brown with a tasteful border in brown and yellow. A new departure has been made by the firm this year in sending out with their calendar, instead of the customary circular, a reprint of the illustrated article, " A Pioneer Metal House," which appeared in *The Metal Worker* of December 25, 1897. This will no doubt come as a pleasing and interesting souvenirs to their many friends and customers throughout the country.

Alphabetical List of Makers' Brands of American Tin and Terne Plate.

(N. B.—The numbers given below correspond to those opposite the names of makers on the supplement pages.)

The British Tin Plate Industry in 1897.

In its review of the British iron and steel industries for the year 1897 the *Iron and Coal Trades Review* of London includes the following remarks regarding the tin plate industry:

The tin plate industry has had an exceptionally checkered career during 1897. Several times during the year it looked as if there was likely to be a considerable revival of demand; but these prospects have been dashed again and again by renewed depression, so that the mills have been worked with rather more irregularity than usual. The exports rose from a total of 18,218 tons in December of 1896 to one of 28,201 in March of 1897. This advance, however, was not maintained during the later periods of the year, and in July, which should have been a good shipping month, the exports fell again to only 18,235 tons, from which point no material rise took place until November, when an export of 24,145 tons was recorded. The total exports of tin plates for the first 11 months of the year were 250,736 tons, against 248,737 tons for the first 11 months of 1896 and 332,547 tons for the first 11 months of 1895.

An indication of the irregular manner in which the tin plate works in South Wales were employed is furnished by the following table:

Number of Mills in the Tin Plate Works that Have Made Returns to the Board of Trade at the End of Each Month—November, 1896, *to October*, 1897.

Month.	Mills working.	Mills not working.	Total.	No. of works reporting.
1896.				
November	261	229	490	89
December	328	164	492	89
1897.				
January	332	155	487	87
February	334	149	483	87
March	320	167	487	88
April	307	180	487	88
May	302	186	488	88
June	273	215	488	88
July	272	207	479	87
August	275	209	484	88
September	273	211	484	87
October	306	170	485	87
November	325	159	484	86

It will be observed that in the months of November and December of 1896 two more works reported than in any of the months of 1897, which explains the large number of mills recorded. The comparative steadiness in the number of works reporting during the remainder of the year, however, guarantees to a large extent that the figures given for the mills are parallel and relevant to each other. There appears to have been a marked revival of business in December, 1896, when the number of operative mills rose to 328, against 261 in the previous month. In February of 1897 the number of operative mills had increased to 334, which was a record figure for the year. In July the number of mills working had fallen to 272, but in October again, with the same number of works reporting, the number had increased to 306.

Rope transmission of power will be employed in the plant of the Shenango Tin Plate Company, now under construction at New Castle, Pa.

The Ferguson Tin Plate Company have decided not to remove their dipping plant from East Liberty to Uniontown, Pa., as was contemplated. It is possible that the company in the near future may erect a rolling mill plant for the production of their own Black Plate at some other location.

The prolonged strike and lockout among the window glass workers of the Indiana gas belt is at an end, arrangements having been made to start up all the factories next week. About 15,000 men, who have been idle since July, will return to work at an advance of from 13 to 17 per cent. over last year's wages.

New Publications.

COPPER MANUAL.—Published by D. Houston & Co., 25 Platt street, New York. Price, $2.

D. Houston & Co., who have been conspicuous as copper brokers, and who issue an admirable monthly review of the copper situation, have published a handsomely printed volume entitled "Copper Manual." General information concerning the copper industry of the United States is presented, together with more detailed data relative to the leading producing companies—the Anaconda, Boston & Montana, Calumet & Hecla, Quincy, Tamarack, Atlantic, Central, Franklin, Wolverine, Kearsarge, Butte & Boston and Centennial. We note also a sketch of the Orford Copper Company, a review of the Arizona mines, and information concerning the three great concerns of the Spanish Peninsula, the Tharsis, Rio Tinto and Mason & Barry. In many cases these descriptions are accompanied by handsome plates of the plants of the mines and photographs of the leading men connected with them. A list of the brass and copper rolling mills of the United States is published, followed by a historical sketch of some of the great plants of the Naugatuck Valley, among them being the Benedict & Burnham Mfg. Company, the Coe Brass Mfg. Company, Randolph & Clowes, the Waterbury Brass Company and Holmes, Booth & Haydens.

Coal or Coke Basket.

A coal or coke basket, which the J. W. Paxson Company, Pier 45 N. Delaware avenue, Philadelphia, are offering, is illustrated herewith. The basket has an iron frame

Fig. 1.—Coal or Coke Basket.

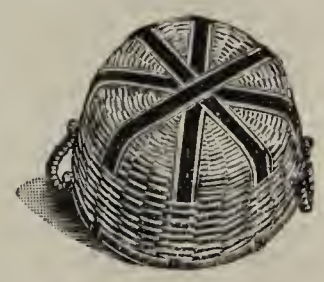

Fig. 2.—Bottom View of Basket.

interwoven with hickory, which it is claimed insures strong and durable construction. The basket is designed particularly for use in coal yards, foundries, steamships &c., and is supplied in four sizes.

New Railways in 1897.

The *Railway Age* of Chicago makes the following statement regarding new railway lines built in the United States in 1897:

While the year 1897 has shown larger railway earnings and better business conditions than its immediate predecessors the marked improvement in the financial outlook did not begin early enough in the year for the completion of many new railway undertakings, and so it now appears that, although much construction work is under way the mileage of track actually laid is but little greater than that for the preceding year.

The lowest point in 20 years in respect to railway building was reached in 1895, when only 1803 miles of track were added, and 1897 has done a little better, the total now reported to us being 1864 miles. California stands first, with 210 miles laid on different roads, and no track was laid in New Hampshire, Rhode Island, Connecticut, Maryland, Kansas, Nebraska, New Mexico, Indian Territory, Arizona, Wyoming and Nevada, and five others barely escaped from this category. At the commencement of 1898 the United States will have 184,464 miles of completed railway.

THE RETAIL STORE.

Tinware and House Furnishing Goods.

To the makers of tinware, enameled ware and house furnishing goods generally the past year brought a substantial expansion in the volume of their business over 1896. The increase in the amount of goods sold, while varying with the different concerns, may be put down at an average of about 20 to 25 per cent. Unfortunately, however, the course of prices has been in an inverse ratio to the volume of business transacted. Consequently the final result in dollars and cents was by no means commensurate with the increase in the amount of goods distributed. A slim margin of profit is the subject of general complaint among those engaged in making and marketing house furnishing goods. Competition has become sharper as the output has increased, and profits have been pared down so close as to have nearly reached the vanishing point in some lines. This is true both of tinware and enameled ware.

Enameled Ware.

A feature of the year has been the rapidly growing displacement of tin utensils by enameled goods in the domestic economy of all classes. The fact of a number of new concerns having embarked in the manufacture of enameled ware has brought about so much competition in this line that prices of enameled ware have been cut down to about the level at which tinware was sold a short time back. The cheapness of enameled ware now places it within the reach of all, and the demand has increased enormously in consequence. At the same time the production of the cheaper qualities of these goods has expanded so materially that it has outrun the consumption, with the result of the keen competition and close cutting of prices before alluded to. To obviate this state of things, and secure a fair profit on the business, a movement was set on foot toward the end of the year looking to a combination among the manufacturers of enameled and stamped ware. A number of meetings and conferences were held, and the matter was fully canvassed, with the result, as is understood, that most of the concerns in the business have expressed themselves as being ready to join the proposed combination. Two or three of the largest interests, however, are still holding aloof, and no final arrangements have yet been made.

Manufacturers' Views.

We have received a number of interesting reports from firms engaged in the manufacture of house furnishing goods in various parts of the country, extracts from some of which are appended:

A large concern manufacturing stamped and pieced tinware and enameled ware write as follows: Our business is about 25 per cent. ahead of last year up to the present time. Profits on the staple articles in our line have been cut closer than ever before, and the prices are lower. We can see no reason why next year's business should not be equal to this, or why it should be more. If prices continue to decline as they have done during the fall of the year (notwithstanding most of the manufacturers in our line, as far as we know, have been busy) it will be a hard matter to figure any profit out of the business. We do not see how the prices can be put on a higher level without some concerted action on the part of the manufacturers. In some lines indications point to co-operation, but this does not apply to the complete line of goods.

A company in the Eastern States making a large line of tin, brass, copper and nickel plated ware, say: We are just closing a very busy year. There has been an increasing demand for all our products since early spring, and although we do not consider that "prosperity" is yet in full swing, we are greatly encouraged by the volume of business done. All our salesmen report the country in first-class shape, especially the West, and predict still better times for 1898. Collections are very good, and we have had few failures in comparison with former years. We look forward to a very prosperous season next year.

Another Eastern tinware concern say that the volume of their sales during the year has been materially increased. Collections have been, on the whole, easier to make and more satisfactory than during 1896. Competition, however, has been very keen. They anticipate a considerable improvement during 1898.

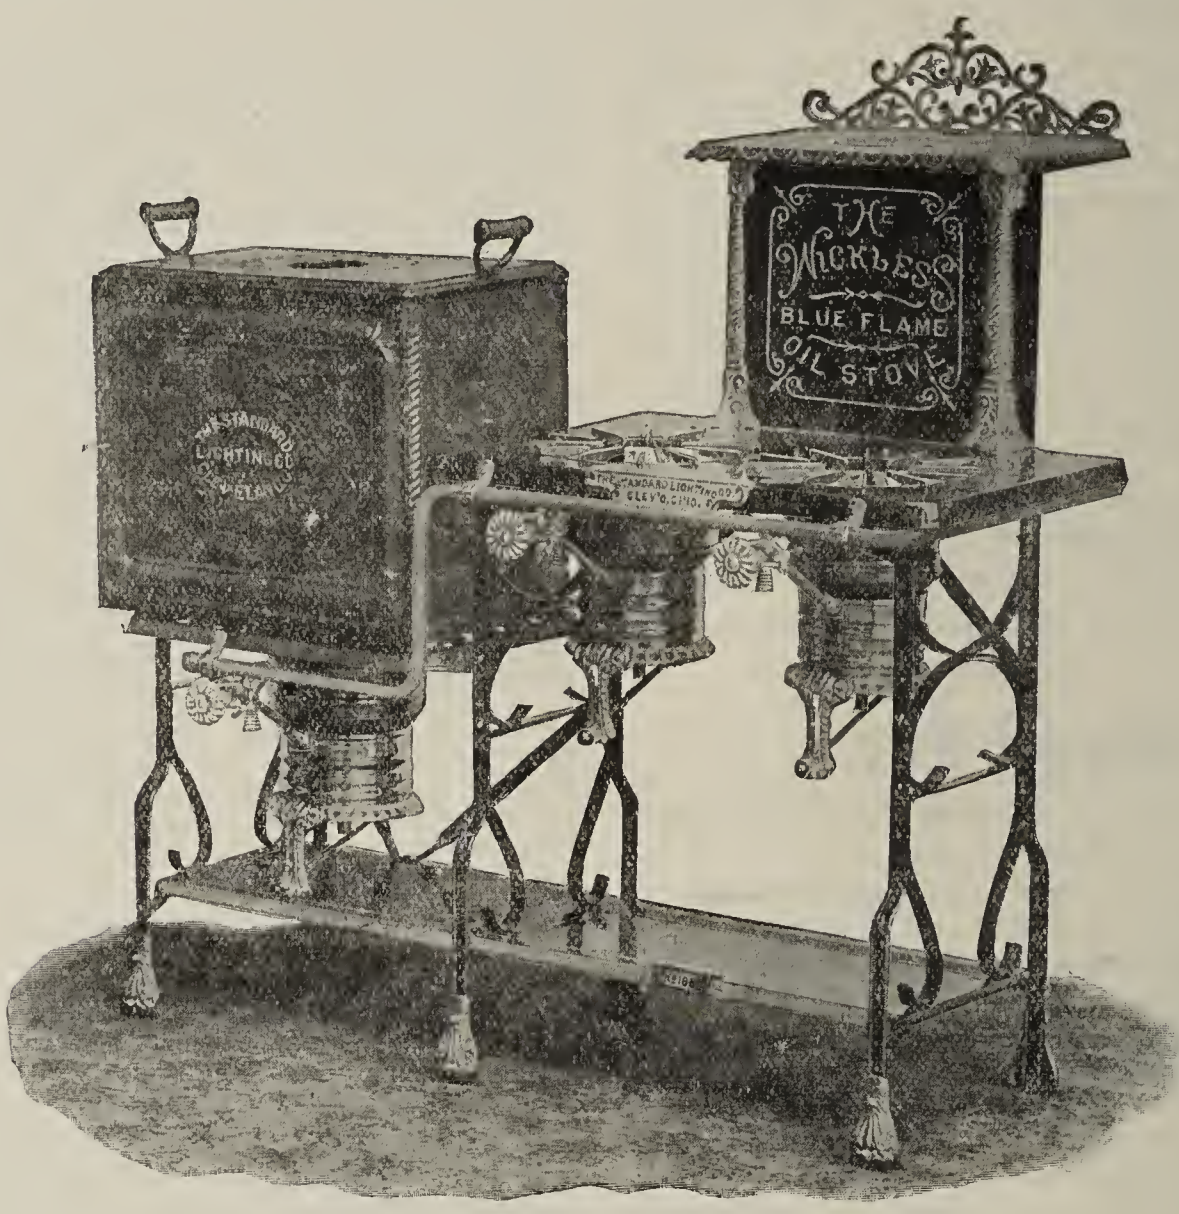
A concern making high grade metal household goods in the East write as follows: Our business has been much greater in volume this year than last, owing, possibly, to the better financial times throughout the country, and the demand on the part of the great wage earning class for a good article, such as we make, when obliged to buy house furnishing goods of this sort. We consider prospects for the coming year very bright, although profits must necessarily depend upon the volume of business rather than upon large margins on small volume. We do not think prices which have been cut down will ever be recovered in our line, as the supply bids fair to be always greater than the demand; but we think there is a good chance for new articles of one sort or another, and there is no reason why they should not bring profitable prices until competition sets in and drives them down.

THE PACIFIC COAST.

The Pacific Sheet Metal Works, San Francisco, Cal., write us as follows: For the past year on the Pacific Coast there has been a fairly good business in packers' cans and in the general manufacture of tin products; but while the volume of business has been very good, the margin of profits has been closer than in previous years. At the present time there are on the Pacific Coast eight establishments for the manufacture of packers' cans, where but two existed a few years since, and as the field for consumption is limited, necessarily competition has become very active. Regarding the prospects for trade during the coming year, while it is dangerous to prophesy as to what may occur, yet from the present outlook there should be a good demand, both from packers and from the general trade. The discovery of the gold fields in northern Alaska has stimulated all kinds of business on this coast, and the branch that we are engaged in will probably feel some of the beneficial effects of increased demand. Collections have been fairly good, and most of the people that we are brought in contact with seem to be living on "Easy street."

Aluminum Utensils.

A material reduction in the price of aluminum which took place during the year has stimulated the use of household utensils of that metal to some extent. Aluminum ware, however, has not made the rapid progress in public favor that was expected of it, although its real merits are becoming more generally appreciated by the people. The price of the ware, while considerably lower than it was a year ago, is still too high to bring it into competition with tin and enameled ware, so that it remains out of reach of the majority of householders. The large department stores which handle these goods report an improved demand for them during the latter half of the year. Considerable progress has been made by the



manufacturers of aluminum utensils in the improvement of their product, and the lines now on the market embrace almost every article made in tin or other metal. The outlook for an increasing trade in aluminum ware during the coming year is considered very favorable.

North Dakota Retail Hardware Association.

The second meeting of the North Dakota Retail Hardware Association will be held at Fargo on Wednesday, February 16. This association was organized in that city on September 29 last, and now has a membership of something over 100 exclusive Hardware dealers. There are 190 such merchants in the State, so that the association already comprises a majority of the Hardwaremen of North Dakota. A membership committee, composed of one member from every county in which there is a Hardware dealer, has been appointed. The Fargo meeting promises to be an interesting one, as matters of much importance are to be up for discussion. We understand that the association has taken up the matter of sales to catalogue houses and department stores in their State by jobbers and manufacturers, and that a large number of them have promised to support the association. If these promises are adhered to, and the members of the organization do their part, confidence is felt that the association will accomplish the end they have in view. Clark W. Kelley of Devil's Lake is president of the association and C. N. Barnes of Grand Forks is secretary.

A Wickless Oil Stove.

For several years a number of minds have been at work trying to produce a burner for a coal oil cook stove that would burn without a wick. We herewith show a cut of a wickless oil stove, Fig. 1, made by the Standard Lighting Company of Cleveland, Ohio, also a sectional cut, Fig. 2, showing the operation of the burner. The reservoir is constructed on the student lamp principle, and connected to ½-inch pipe which passes around to the front of the stove. The oil is then fed from this pipe to the burner through a valve into a ⅜-inch pipe to the channel of the burner, saturating a brass gauze starting ring. When this ring is saturated a light is applied to it and the burner is ready for use, but it requires about two or three minutes after lighting to develop a full sized flame. A special feature of this burner is that oil, and not vapor, is burned. All parts of the burner are readily removable, interchangeable and easily kept clean. This stove is made in ten different sizes, and admits of drawing the fuel for both heating and lighting from the same barrel.

A Wickless Oil Stove.—Fig. 1.—General View.

The well-known house of George Tritch Hardware Company, Denver, Col., will start the new year by adding a complete stock of Sporting Goods to their large and comprehensive line of Hardware. The company refer to their intention of meeting the wants of their many customers in the Rocky Mountain section as efficiently in this line as in the other departments of their business. They advise us that they would be pleased to hear from all manufacturers of goods of this class.

E. A. Rea, dealer in Hardware, Agricultural Implements, Stoves, Tinware, Harness, Seeds, &c., Corydon, Wayne County, Iowa, is just completing a new warehouse in the rear of his present store building. The warehouse is of brick, two stories high, 60 feet wide by 184 feet in length. Mr. Rea's present building, also of brick, is 40 x 160 feet, two stories, with basement. The new building, joining the old, will make a total length of 344 feet. Mr. Rea also conducts a branch store at Chariton.

Fraser & Nolan have purchased the Hardware business of James & Son, Napa, Cal. Some changes have been made in the establishment and the counters now run lengthwise with the store instead of across, as formerly. Besides handling Hardware, Stoves, Implements, &c., the firm have a plumbing and tinning department, under the management of Mr. Nolan.

Sims & DeLon have succeeded Sims, Richards & Richards in the Hardware line in Russiaville, Ind. The stock carried comprises Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, &c.

W. H. Mandeville has purchased the interest of V. D. Lobdell in the firm of Mandeville & Lobdell, 1003 and 1005 South Main street, Rockford, Ill., and will continue the business under his own name. The stock includes Hardware, Tinware, Stoves, &c.

Geo. Mayer Hardware Company, Denver, Col., have removed to more commodious quarters at 1512 to 1520 Arapahoe street, where they are in much better position to conduct the wholesale and retail business in Hardware, Stoves, Cutlery, Bicycles, &c. They will be pleased to hear from manufacturers with catalogues, quotations, &c.

MEMORANDA.

I. J. Clabaugh, dealer in Hardware, Tinware, Harness, Agricultural Implements, &c., New Hampton, Mo., is now comfortably settled in his new building, which is 24 feet wide by 70 feet in length.

Chas. S. Johnson, Barberton, Ohio, has doubled his storeroom space by taking in adjoining premises. Mr. Johnson advises us that he has added considerably to his former large stock of Hardware, House Furnishing Goods, Farm Implements, Stoves, &c. Business is referred to as excellent.

Otto J. Baertich has purchased the entire interest of his father, Herrman Baertich, in the Hardware business in Troy, Ind. Mr. Baertich makes a specialty of Heating and Cooking Stoves and Ranges, and handles also a full line of Agricultural Implements, Tinware, &c.

W C. Allison has succeeded Allison & Boyington in the Hardware business in Muscoutah, Kan. Mr. Allison's line covers Shelf Hardware, Stoves, Tinware, Agricultural Implements, Buggies, Sporting Goods, &c.

John Conwell of Xenia, Ohio, will shortly open up a Hardware store in Spring Valley, Ohio. The business will be conducted under the style of the J. C. Conwell Company, and the stock will comprise Shelf Hardware, Stoves, Tinware, Agricultural Implements, &c.

William Love, retail dealer in Shelf Hardware, Tinware, Stoves, Garden Implements, &c., 1659 Main street, Buffalo, N. Y., has lately installed new shelving in his store. Mr. Love has also adopted a system of burglar protection in view of a recent visit of thieves. He has also just commenced the use of natural gas for illuminating purposes. Mr. Love reports a good condition of business, improvement being noted over the same period of last year.

During the past year the American Stamping Company, Brooklyn, N. Y., have greatly increased their facilities for making Enameled Ware by the addition of new buildings and machinery. They contemplate still further additions in the near future.

The W. H. Sweeney Mfg. Company, manufacturers of Tin, Brass, Copper and Nickel Plated Ware, Brooklyn, N. Y., are making several changes in their factory, which will enable them to increase their output considerably. The company look forward to a very busy season next year.

The Enterprise Enamel Company have recently organized at Bellaire, Ohio, for the manufacture of Enameled Hollow Ware. William Lephardt is president of the company, C. L. Doon vice-president, Theo. Rossbock general manager and Jas. F. Du Bois secretary and treasurer.

Small circulars sent out by the Morgan Mfg. Company, 112 Dearborn street, Chicago, Ill., call attention to some of the specialties of this concern. One relates to the Morgan Broiler, another to the Morgan Steam Egg Poacher and a third to the Sun Pan Cake Griddle.

John Quaritius, Hicksville, L. I., has installed Hot Air Furnaces in the fine residence of C. C. J. Grohmann, Central Park, and in the residence of Matthew McGunnigle.

Joseph F. Romberger, Berrysburg, Pa., who has been in the general merchandise business for 30 years, has opened up a new Hardware store in that place. Mr. Romberger is handling Stoves, Tinware and Agricultural Implements in connection with a line of Shelf Hardware.

W. H. Cowan has succeeded Millsap & Co. in the retail Hardware and Tinware business in Boston, Ark.

H. W. Diers has moved his Tin business from Belle Plaine, Minn., to Roberts, Wis., where he has added a line of Hardware and Stoves to his former stock.

Manning & Hall have succeeded Baker & Hall in the retail Hardware, Stove, Tinware, Agricultural Implement and Sporting Goods business in Gypsum, Kan.

E. M. Lang & Co., 71 Kennebec street, Portland, Maine, manufacturers of Wire, Drop and Stick Solder, have incorporated under the name of E. M. Lang Com pany. They began business under the new title December 15.

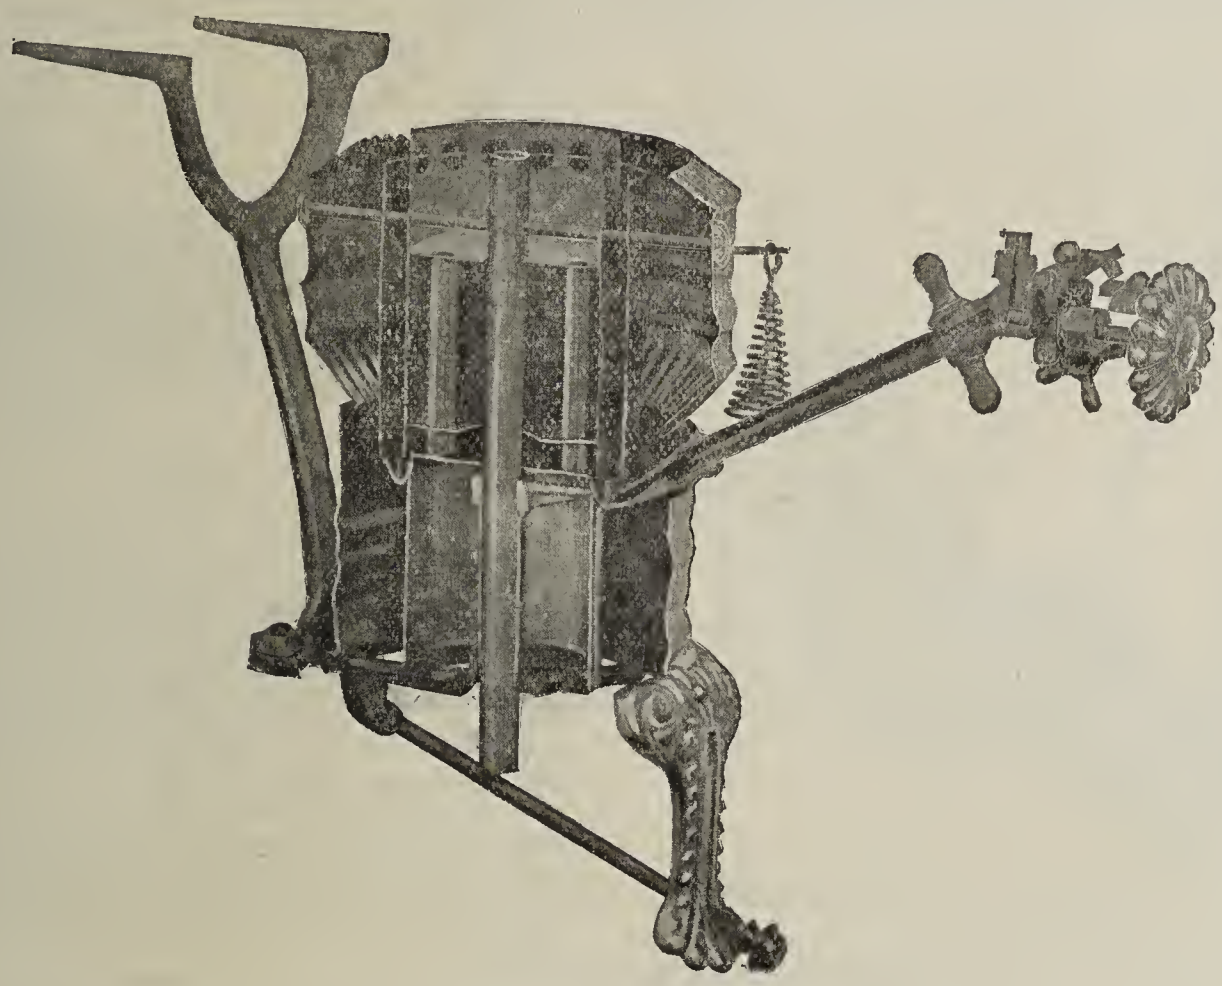


Fig. 2.—Section through Burner.

Stowell Mfg. & Foundry Company, South Milwaukee, Wis., have issued a new catalogue of 128 pages, cloth bound, devoted to Hardware, Door Hangers and Rail, Warm Air Registers and Ventilators, Tackle Blocks, &c. A view of their large plant is presented as a frontispiece. In addition to the lines heretofore manufactured by them they illustrate new designs of Registers and Elevator Hangers, Badger Barn Door Hangers, Shoe Lasts and Stands, Ash Pit Doors and the Stowell Steel Parlor Door Hanger, calling special attention to the Stowell Hanger, which has, they state, made a name for itself in the less than a year it has been on the market. They also refer to the popular merits of their patent Self Locking Loose Axle. The company have added a new line of Plumbers' Supplies, consisting of Sinks, Cistern Covers, &c. Mention is also made of their facilities for fine japanning, light machine work, Gray Iron and Brass Castings, &c. Accompanying the book is the price-list of Hot Air Registers and Ventilators, which became effective December 20, 1897.

The great Coliseum in Chicago, which has housed a number of historic events in its brief career, was burned on Christmas eve. The loss was $350,000 on the building and perhaps as much more on exhibits which had been installed for a winter exhibition of all sorts of manufactured products. The building was totally destroyed and will not be replaced. Another project is now on foot to erect a much larger building of the same general character, for amusement purposes, national conventions, &c., to be located on the lake front, convenient to the heart of the city.

Palmers' Utopia Hammock.

I. E. Palmer, Middletown, Conn., is manufacturing an entirely new hammock, as shown in the accompanying

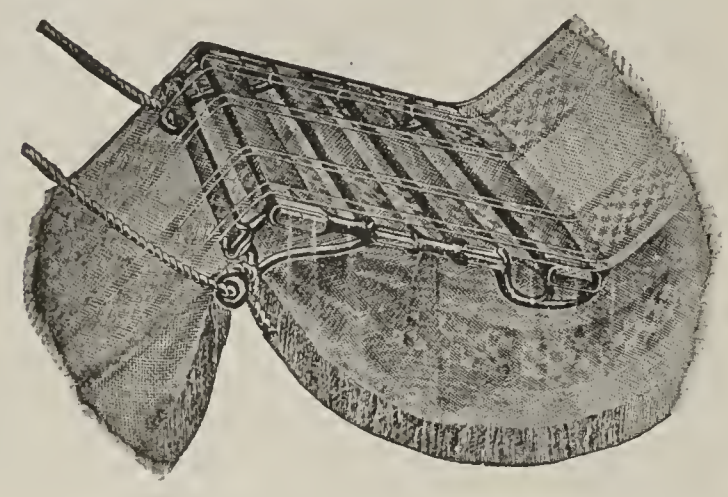

Fig. 1.—Sectional View of Seat of Utopia Hammock.

illustrations. This hammock is styled the Utopia, and is an addition to an already comprehensive line widely known. Fig. 1 is a sectional view showing the Utopia

Fig. 2.—Utopia Hammock Swung for Reading Position.

hammock seat, which is composed of two malleable iron sides, three fixed slats and two removable slats. For the purpose of varying the length between the seat and the

Fig. 3.—A Reclining Position.

pillow and for detaching the seat from the hammock, the front slat is made removable from the hammock body by pressing a spring similar in character to an umbrella spring at one of its ends. The body of the hammock is provided with a number of pockets in close proximity, for the purpose of receiving the removable slats for adjustment. The back slat is made removable only for the purpose of detaching the seat from the hammock, the pocket for this slat being made of sufficient length or width to admit of any desired adjustment of the seat by means of the front slat. The body of the hammock for receiving the seat is quite similar in general character to the regular Palmer hammock body. The features for adapting the body to the seat are simply the attachment of an under web to the hammock body proper, at such intervals as to form the required pockets. Ropes from an extra ring connect with the arms at the front of seat support and permit adjustment of seat and foot portion of hammock. Fig. 2 represents the occupant in a comfortable reading posture with arm supporters. The distance between the supporting rings may be varied according to the location of hanging and desired recline, ranging from 5 to 8 feet. Fig. 3 illustrates a reclining position, which may be altered at will to a more upright form by raising the head end and lower-

Fig. 4 —Full Reclining Position.

ing the opposite end at points of suspension, and *vice versa* if more recline is wanted. The feet may be raised or lowered by the extra side cord and sliding grip. In Fig. 4 is seen the full reclining position, which may be altered to sleeping position by lowering the head end. The illustrations, and in greater detail the catalogue of the manufacturer, give exact measurements for attaching cords so that different positions of the hammock may be secured without experimentation by the user. In 1883 Mr. Palmer introduced the Palmer woven hammocks, with pillow, spreader, divided suspension and other distinctive features, which are known as the Arawana and Perfection hammocks. Later he applied to the hammock the valance or ornamental drapery suspended fringe-like from the edges.

The Addyston Pipe & Steel Company state that they are having no trouble with the pipe which they are furnishing to the city of Chicago on their great contract. They attribute the reports in circulation relative to defective pipe to the rivalry between inspection bureaus. Up to the beginning of this week they had delivered 3000 pieces of pipe, of which four were broken in transit and were replaced, while six others were considered not quite up to the mark by their own inspector and were also replaced. The inspection is rigorous, but the company are living up to it without any difficulty and the Chicago authorities are stated to be thoroughly satisfied with the pipe which they are receiving.

There is some dissatisfaction existing at the present time among puddlers employed in the mills in the Pittsburgh and Valley districts. The present rate for puddling is $4 a ton, and the puddlers insist that the rate should not be below $4.50 a ton. They refer to recent advances made in wages of steel workers in support of their claim that higher prices should be paid for boiling. It is not likely, however, that any advance will be made in puddling before the time for the arrangement of the boiling scale in June next, and no advance may be made at that time.

The dividends of the Westinghouse interests at Pittsburgh, all payable in January, include $500,000 on stock of Westinghouse Air Brake Company, $75,000 on Philadelphia Natural Gas Company, $52,500 on first preferred stock of Westinghouse Electric & Mfg. Company, $40,000 on Allegheny Heating Company, $22,500 on Allegheny County Light Company and $7500 on Union Switch & Signal Company preferred stock.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Business of merely fair proportions is all that has been effected in this metal and wholesale prices have undergone only slight variation in the absence of any radical change in the London market. Jobbers continue to quote small parcels of Straits Pig from store at 14¾c. per lb. There has been fairly liberal importation since the beginning of the month, or about 1300 tons all told, and deliveries into consumptive channels barely reached late average proportions. The local statistical position is, however, presumably weaker and a nowise insignificant factor.

Copper.—Exports have been quite liberal, and doubtless as large as could be expected in view of more or less scarcity of ocean tonnage for the present and next two or three months. Home deliveries, to all accounts, were of merely fair proportions, and nothing in the way of lively buying interest is manifested at present. Prices are held quite firmly, however. In a retail way sales were of very moderate proportions, while dealers' prices for small lots remain unchanged at about 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—There is nothing new to report in this market. The demand, as is usual at the close of the year, is confined to small orders for immediate use. Consumers and dealers are stock taking, and the holiday week is not favorable to new business. A much better demand is looked for after the beginning of the new year, and the manufacturers are in good shape to meet it. Prices show no quotable change, but are fairly firm. Jobbers quote Sheet Copper at about 15c. per lb., basis.

Pig Lead.—Scarcely anything has been done outside of commonplace business in small lots, and the market remains in somewhat uncertain shape, with indications that large consumers are not only placing orders very conservatively but sparing no effort in the direction of helping along any real or fancied weakness. The retail trade has been equally quiet with the wholesale, there being quite a lull in dealers' business just now. Jobbers' prices for American Pig are about 4⅛c. to 4¼c. per lb. for small quantities.

Spelter.—The market for this metal remains in a dull and rather weak condition. Not only are sales moderate, but the demand is slow, and some difficulty has been experienced with local "official" efforts to belittle the importance of the present heavy production. The only sales made are of small lots for current use. Retail prices for good Western brands in moderate sized lots continue to be quoted at 4.45c. to 4½c. per lb.

Sheet Zinc.—There are no features of interest in connection with this material. The demand has been slack, and prices display no variation. Jobbers quote 600-lb. cask lots at 5⅝c. to 5¾c. per lb., and smaller quantities at 6⅛c. to 6¼c.

Antimony.—The market has been slow, and prices are rather easier at about 7¼c. for Japanese, 7½c. for Hallett's and 8½c. for Cookson's in small parcels.

Aluminum.—A fairly large demand continues for this metal. Prices are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—For the last week of the year the volume of business in American plates has been fairly large. Orders for Cokes were placed to some amount for delivery over the first quarter of next year, but the dealings were invariably at low prices and the market closed in a somewhat weakish condition. A meeting of the Tin Plate makers was held this week at Columbus, Ohio, which, it is thought, may result in some sort of agreement whereby prices should be placed on a more satisfactory footing. As stocks of all kinds of Tin Plate are light and the mills are fairly well booked with orders ahead, there seems no valid reason why prices should be as weak as they are just now. The small retail business was of the lightest character, as is natural in the closing week of the year. Jobbers' prices on American Plates are nominally unchanged at about the following for moderate sized lots for spot delivery at New York, Philadelphia or Baltimore: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, 1C, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates remain very quiet and values are largely nominal in the absence of any material addition to stocks in importers' hands.

Sheet Iron.—A fairly liberal demand continues for both Black and Galvanized Sheets from mill. The mills are all busy on orders and makers look for a large tonnage next year. For this reason they are adhering strictly to quotations. Very little beyond a peddling business is being done in Sheets by the jobbers. Small lots from stock are firm at about 2.35c. to 2.40c. for No. 27 Common Black Sheets, and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: Both buyers and sellers are talking higher prices. Buyers are asking for quotations on long deliveries, but sellers are disposed to shorten the time and consequently both parties are slow to close. Small lots from stock are held at 2.20c. to 2.25c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—The market has been very dull. Consumers and exporters are alike holding off. Prices, while unchanged, are rather inclined to weakness. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	4.50

THE IRON MARKET.

Considering the season, an unusually large amount of business has been done during the week under review both in the cruder forms and in finished material. There has been quite a good deal of covering requirements of raw materials for the first three to six months of the coming year.

In Foundry Iron some large melters in the Philadelphia district have purchased quite heavily, one Pipe concern taking between 20,000 and 25,000 tons of Pig Iron, dividing the order between Eastern Pennsylvania, Virginia and Alabama furnaces. In Cincinnati, the leading market for Southern Iron, there has been a heavy run of inquiries, brought out, evidently, by the changed attitude of the selling interests.

The Billet market has been quiet, but on the other hand there have been sold very large quantities of Tin Plate and Sheet Bars, the tonnage running up to 40,000 tons. In the Chicago district, too, some larger sales of this character have been made.

Pig Iron.—The New York market has been quiet, with a fair run of moderate orders. In New England there has been a little more activity. The large buyers in the metropolitan district are pretty well covered for some time to come and are indifferent. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No 1, $10.75 to $11.25; No. 2, $10.25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

At the moment the market for Pig Iron in Philadelphia is drifting around in such an indefinite way that it is almost impossible to say what are really and absolutely rock bottom prices. To offset the advance in freights recent quotations ought to be advanced, but in view of the low figures accepted in recent transactions it is probable that quotations will be unchanged at the old figures, which so far as sellers are concerned is a decline of 15c. to 25c. per ton. Seaboard quotations therefore

remain as follows, subject to the usual freight differences at points within 100 miles south or west : No. 1 X Foundry, $12 to $12.25 ; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11.

More inquiries appeared in the Chicago Pig Iron market this week than for a considerable time. Some contracts were placed, but more were deferred until after the New Year. The sales made cover both Foundry and Malleable Irons. The local producers secured the bulk of the business, but some fair sized sales were made by Southern agents. Prices on Southern Irons are a little lower on some brands, but the leading companies continue to quote full prices. It is expected that the cheap sellers will very speedily be able to dispose of all the Iron they wish to sell at low rates. Business in Lake Superior Charcoal has been light. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.00 to 11.50
Southern Coke, No. 1	10.75 to 11.25
Southern Coke, No. 2	10.35 to 11.00
Southern Coke, No. 3	10.10 to 10.60
Southern, No. 1 Soft	10.75 to 11.25
Southern, No. 2 Soft	10.35 to 11.00
Foundry Forge	9.85 to 10.10

The Pig Iron market in the Pittsburgh district has been fairly active, some good sized lots of Bessemer having been sold for the first three and four months of the year. In view of the large production of Bessemer Pig, and the fact that maximum consumption has about been reached, it does not seem that there can be much improvement in prices early in the year at least. We quote, f.o.b. Pittsburgh: No. 1 Foundry, $10.50 to $10.75; No. 2, $10 to $10.25; Bessemer, $10 to $10.15.

CHICAGO REPORT.

Scrap.—The situation shows no change. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—Not much business is doing and prices are still weak. The card on carload lots of 12 tons minimum is as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

Comparatively little effort is being made to sell goods, either by manufacturers or wholesale merchants, who are content to take care of such orders as come along of their own accord, travelers being nearly all at home and the volume of business at a minimum. Attention is directed especially to the questions connected with the closing of the year's trade, taking stock, balancing books, &c. The changes which are taking place in business methods and the new problems which confront the trade, together with the too familiar matters of increasing costs and narrowing profits, afford subject for serious thought on the part of those who recognize the necessity of conforming their methods to changing conditions and avoid being left behind on account of failure to fall in with the movement of trade. Similar questions, assuming naturally a somewhat different form, present themselves to the retail merchant, and in connection with the taking of the annual inventory and ascertaining the results of the year's business it will be the part of wisdom for them to carefully consider their business methods and judge of the wisdom of such changes or new departures as they have made and the advisability of further enterprise in maintaining and extending trade. For merchants of all classes the prices at which they sell are as important as those at which they buy, and it will doubtless be admitted by many Hardware merchants, both wholesale and retail, that too little attention has been given to making reasonable profits on their goods. How to do this in view of existing competition is one of the great questions which should have careful consideration. Notwithstanding the fact that we are in the midst of the holiday season, when business is limited for the most part to the sale of such goods as are immediately required, there continues to be a fair movement of trade. In some heavy lines the condition of the market induces liberal purchases, and in general Hardware the demand is unusually good considering the time of year. Prices show but little general change. Wire and Wire products are firm. The Screw market is evidently in an improved condition and higher prices are announced. The general feeling is that there will be next season a large volume of business and more satisfactory conditions. We trust that these anticipations may be realized and that in the resulting prosperity our readers may have a full share.

Advices from Chicago.—The Shelf Hardware trade is still unusually active for December, but shows some falling off as compared with the early part of the month. Traveling men are now in for the holidays, and business is almost entirely confined to mail orders from customers who cannot wait for salesmen's visits. The demand for Tinware and House Furnishing Goods, Metals, &c., is quiet. Heavy Hardware jobbers report the usual quiet condition of trade found at the holiday season. Their customers are for the most part engaged in taking stock, but renewed buying is expected immediately after the opening of the new year.

NOTES ON PRICES.

Wire Nails.—The same general conditions which have prevailed for several weeks still characterize the Wire Nail market, the principal change being in the tendency toward somewhat higher prices. The trade are buying pretty freely, but most of them have covered their immediate requirements, and manufacturers are refraining from accepting orders except for prompt delivery. They evidently desire to be in a position to avail themselves of any advance in prices that may occur. While there are no new developments in regard to the efforts making for a consolidation of Wire Rod interests, the market is affected by the fact that negotiations are being conducted with this end in view, and while it is acknowledged that there is uncertainty as to the final outcome the probability of a successful consummation is conceded.

Advices from Chicago.—Manufacturers have had a good trade, and are receiving inquiries for future delivery, but refuse to quote for anything except for immediate shipment. Jobbers have marked up their prices for small lots and quote $1.60.

Cut Nails.—The Cut Nail market is without important change, and as it is not stimulated by the probability of an early advance business is sluggish, purchases being limited to the immediate requirements of the trade These, as usual at this season, are comparatively small.

Advices from Chicago.—No change is seen in this branch of trade, small lots from stock being held at $1.45.

Barb Wire.—The Barb Wire market is affected by the Wire Rod negotiations and has a firm tone. The volume of business is fair, but manufacturers are unwilling to accept orders for future delivery.

Advices from Chicago.—Inquiries continue to come in

for Barb Wire and the outlook for business is very good indeed. Small lots from stock are selling at $1.65 for Painted and $1.95 for Galvanized.

Smooth Wire.—In sympathy with the condition of the Wire market generally Smooth Wire is decidedly firm, with a fair volume of business.

Market and Stone Wire.—Some of the manufacturers of Market and Stone Wire are withdrawing their extreme discounts and naming slightly higher prices. This is on account of the probability of an advance in the raw material.

Screws.—During the past week the Screw market has been steadily improving in tone, most of the manufacturers uniting in the adoption of discount 87½ and 10 per cent. as the price of Flat Head Iron Screws, instead of 90 per cent., which has been the general base. One or two companies deferred action to see whether or not the movement would be general, recognizing that unless the new prices were adopted by all the prominent manufacturers it would not be feasible to maintain them. At a meeting held to-day (Wednesday) united action, however, was taken, to which all the manufacturers are parties, adopting the following discounts, which go into effect immediately:

	Per cent.
Flat Head Iron	87½ and 10
" " Japanned	85
" " Brass	87½ and 10
" " Bronze Metal	85 and 10
Round and Oval Head Iron	85
" " " " Brass	85
" " " " Bronze Metal	85
Flat Head Iron Screws, Blued	5 per cent. added

The prices which have ruled during the past year have been exceedingly low, being, it is said, only about one-seventh of those of 25 years ago, and they are also lower than those prevailing in England. Notwithstanding this fact there has been comparatively little speculative buying, although it is understood that some of the manufacturers have booked a good many orders. The announcement of the advanced prices will be received with approval by the trade and should have a good effect on the market.

Glass.—The settlement of the wage question, the early starting of the factories and the prospect of new Glass reaching the market in the near future in sufficient quantities to supply demands has removed uncertainty and speculation from the minds of the trade. January 8 is the date set for the general resumption of the factories, two or three weeks after which new Glass may be expected to reach the market. The start will be four months later than the usual date of September 1, and although the manufacturing capacity will be larger than ever before in this country it is estimated that not more than 4,000,000 50-foot boxes of Glass can be turned out by June 30. This quantity of Glass it is expected will be consumed by the early part of next fall. The American Glass Company are reported as preparing a new Glass list, considerably higher than the present one, which will be subject to larger discounts. The frequent changing of the price-list of Glass misleads no one as to the net advance in each size, save a few small retailers who perhaps do not take the trouble to figure out the discounts. A reduction in discount would accomplish the same purpose as that of advancing the price, and yet preserve a list with which all have become familiar. Upon the recognition accorded the jobbers by the American Glass Company and the price at which American Glass is offered them will largely depend the amount of foreign Glass imported during the following months. American Glass continues to be quoted at 60 per cent. discount by jobbers and imported Glass at 80 and 10 per cent.

White Lead.—Business has proceeded in the usual way for the season and prices have remained stationary for both "combine" and outside brands.

Red Lead.—Orders to about the usual extent for the season are being placed for Red Lead at prices in line with those that have ruled for a considerable time past. Otherwise the market is without feature of interest, there being no disturbing or unusually enlivening influences at work. To all accounts, the orders thus far placed for 1898 delivery are fully up to the volume of those booked a year ago.

Spirits Turpentine.—Stronger advices from the South, along with quite good business here, have carried prices a fraction higher, and the market is now strong at 35 to 35½ cents for retail quantities.

The New York Commercial.—*The Shipping and Commercial List* announces that on the 25th it ceased as a weekly publication. It has been regularly published in New York for 102 years and one week. Beginning with January 3 the paper will be known as the *New York Commercial*, and it will appear daily, except on Sundays and holidays. As the direct descendant of the *New York Prices-Current*, which was established in 1795, the paper enjoys the distinction of being the oldest commercial paper in America. The new form will enable its management to give more forceful, by reason of more frequent, publicity to the great events of the day, as well as to continue the emphasis of the underlying principles of the original publication characterizing it during the past century.

The New York State Railway Commissioners have decided to extend the time for the equipment of freight cars on the railroads in the State with automatic couplers to December 31, 1899. This gives the railroads two additional years in which to comply with the law on the subject.

PLUMBER, first-class mechanic, wants a steady situation in city or country; 20 years' experience; sober and reliable; takes interest in work and will study employer's interest; been foreman in one shop eight years; can furnish best of references as to honesty and ability. J. Usher, 475 East 115th street, New York City. Jan. 1

As TRAVELING SALESMAN by a man with 12 years' experience in retail stove and tin business and six months on the road. J. W. Hackney, 815 W. Chestnut street, Louisville, Ky. Jan. 1

SALESMAN of 12 years' experience would like situation with manufacturer or large hardware house, either on the road or house position; have had experience as manager; can give best references; would like to make change early in January. "Experience," office of *The Metal Worker*, 59 Dearborn street, Chicago, Ill. Jan. 1

Cornice cutter, skylight maker, tinner and tin roofer desires a position as FOREMAN or at the bench; can give references. Joseph P. Coleman, 706 West Chicago avenue, Chicago, Ill. Jan. 1

TINSMITH; proficient job or assortment workman; 45 years of age; non-union workman; best of reference; city or country; wages reasonable. "Francis," office of *The Metal Worker*, 232-238 William street, New York City. Jan. 1

A bright, energetic man, who understands furnace, cornice and all kinds of sheet metal pipe and stove work, is capable of cutting and can detail work from plans, would like a steady position with some reliable firm for the year 1898 in a good town or city; do not answer unless you are in need of a good, steady and reliable workman; am single; can speak German, and have the best of references; wages moderate. "F. A. H.," office of *The Metal Worker*, 512 Commercial Building, St. Louis, Mo. Dec. 25

By a DESIGNER and MODELER for stove ornaments. "W. G.," office of *The Metal Worker*, 232-238 William street, New York City. Dec. 25

A SALESMAN calling on the hardware, drug and grocery jobbing trade with a line of oil cans in Eastern Pennsylvania, New Jersey, Eastern New York and the New England States, desires a line that can be worked in connection with the oil can. 404 Lippencott Building, Philadelphia, Pa. Dec. 25

By a first-class WOOD PATTERN MAKER who can do designing, carving, tinning and all work in stove trade; 13 years' experience; 28 years of age; wages $3 per day. Geo. Guenther, 66 Bertram street, Cleveland, Ohio. Dec. 25

I wish to secure after January 1 the agency for New Orleans and vicinity of a large and reliable wholesale house; I am well known to the trade here through my present connections and can assure a thorough introduction of the products of any firm I may represent; correspondence solicited; references given. Frank Paul Barber, 530 Gravier street, New Orleans, La. Dec. 25

An experienced managing SALESMAN, with first-class connections and acquaintance among the hardware and stove trade in New York City, Brooklyn and vicinity, is in a position to represent manufacturers of all heating and cooking goods or hardware specialties to great advantage in the above territory; first-class references. "H. A.," office of *The Metal Worker*, 232-238 William street, New York City. Dec. 25

By a BOOKKEEPER and SALESMAN with some house in New York; has had office experience in both the wholesale and retail branches of the steam and hot water heating, furnace, plumbing and tinning trades; thoroughly competent and can give references; desire permanent position with a reliable firm. "Qualified," office of *The Metal Worker*, 232-238 William street, New York City. Dec. 25

ILLINOIS ASSOCIATION OF PUBLIC ACCOUNTANTS · 1897 ·

George Wilkinson,

PUBLIC ACCOUNTANT AND AUDITOR,

907 Royal Insurance Building,

CHICAGO.

New York Office, 30 Broad Street.
Cable Address "Careful," Chicago.

Special Notices.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice**, or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"

office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

FOR SALE.

Stove, Tin and Plumbing business in town 15 miles from Boston. Population 4000. Business established 30 years.

Address

C. A. WALES, Randolph, Mass.

FOR SALE CHEAP.

One 30-in. Squaring Shear, in good working order.

One Miller & Hupskin Tin Locking Machine, almost new.

One No. 1, 20-inch Tin Pipe Former, 1½ inch rolls, new.

B. BARTHOLOMEW,
17 East High St., Ashley, O.

FOR SALE.

Furnace patterns cheap, 3 sizes, suitable for hard or soft coal, with 36 inch, 40 inch and 44 inch casings; 20 in., 22 in. and 24 in. pots. This is a rare chance for some one who wishes to go into the manufacture of furnaces without a large outlay for patterns. Address

"FURNACE PATTERNS,"

office of *The Metal Worker*, 59 Dearborn Street, Chicago, Ill.

FOR SALE.

An $8000 stock of Hardware, Stoves, Tin Stock, Furnaces, etc., located in Central Iowa, in a city of 10,000 inhabitants, the "livest" town in Iowa. Sale must be made by January 15 and must be for cash. Business has been established ten years. A rare opportunity for the right man. Address

HAW & McPHERRIN, Oskaloosa, Ia.

A VALUABLE INVENTION.

The attention of Stove manufacturers is called to the Down Draught, Fuel Saving, Smokeless Stove, especially constructed for burning soft coal, lignite, garbage, etc., saving 50% in cost of fuel over any other stove. Several other valuable principles are embodied in this great invention. We solicit correspondence from manufacturers to negotiate for the manufacturing of the stove.

SCHMIDT & CO.,
Room 610, 114 Nassau St., N. Y

WANTED.

Thoroughly good and practical receipts for White Enamel for Cast Iron Bath Tubs. Address, in confidence,

"BATH TUBS,"

office of *The Metal Worker*, 232-238 William St., New York.

PATENTS.

H. W. T. JENNER, Patent Attorney and Mechanical Expert, 608 F St., Washington, D. C. Established 1883. I report as to patentability and the exact cost of a patent free of charge.

Special Notices.

FOR SALE.

Stoves, Tinware, Heating and Plumbing. Live manufacturing town Northern Massachusetts. Sales $16,000 to $18,000 a year. Fine Trade. Well established. Partner wishing to retire, must be sold by January 1. Best chance in New England to make a dollar.

"RETIREMENT,"

office of *The Metal Worker*, 232-238 William St., New York.

FOR SALE.

A good clean, well assorted stock of Hardware, with Plumbing and Tin Shop connected and commanding the best trade in town. Competition consists of one other hardware store. Located in Central New York State in a town of about 7500 inhabitants, having the trunk lines of railroad, paved streets, electric lights, electric street cars, water works, good schools, etc. Stock and fixtures will invoice between $7000 and $8000. Annual sales average about $25,000. This is a rare chance for a cash buyer. Address "RARE CHANCE," office of *The Metal Worker*, 232-238 William St., N. Y.

Register For Sale.

The patentee of a new Improved Dustless Register wants to either sell same or interest manufacturers who can make same. This register can be manufactured 8 to 10% less than any other register on the market and has strong selling points over any other.

A. L. CANFIELD.
284 Pearl Street, New York.

OWING to the death of the proprietor, a Stove, Heating, Plumbing and House Furnishing business is offered for sale, in Claremont, N. H. A growing manufacturing town of over six thousand inhabitants. This is a first-class opportunity for any one wishing to engage in this business.

A. C. STONE, Administrator,
Claremont, N. H.

WE BUY BRASS AND COPPER CLIPPINGS.

Also Scrap Brass, Copper, Lead and Zinc of every description. In writing for prices kindly give description of goods and state quantity.

DETROIT SMELTING & REFINING CO.,
Detroit, Mich.

Manufacturers' Agent OR Resident Salesman,

To sell on commission in Western and Southern cities *a very popular and complete line* of goods that is having a very large sale in the East and is sold by *all* house furnishers.

Address, COMPLETE LINE,
Office of *The Metal Worker*, 232 238 William St., New York.

AVOID MISTAKES AND LOSS BY USING THE CONTRACT and ESTIMATE RECORD BOOK FOR PLUMBERS.

By B. H. JESSUP.

OFFICE EDITION. (Second Enlarged Edition) 200 Pages. Arranged for 100 Estimates, size 9 x 12 inches, cloth, $2.00.

POCKET EDITION. 200 Pages. Arranged for 50 Estimates, size 3½ x 8 inches (oblong), flexible, cloth, $1.00

Plumbers will find the use of the Contract and Estimate Record Books a great saving in money and time.

These carefully prepared books offer a means of recording systematically and with little trouble each estimate or contract and will be of especial value to the trade because they give all the items in connection with each estimate, by which the danger of omission and error is avoided.

Each book contains a list of all material likely to be used in any ordinary house, and parallel columns give space for entering the cost.

OFFICE EDITION.

This edition is specially adapted for desk use The improvements and additions now introduced make this a perfect estimate book.

An alphabetical index is given in the front of this book for entering the names of those for whom estimates have been furnished, together with the number of the page on which the estimate is to be found in detail.

POCKET EDITION.

This book is printed on thin, strong paper, and arranged in the most compact and handy form for pocket use.

At the beginning of each form is a space for the name of the person for whom the estimate is made, and the date.

Plumbers will be well repaid who depart from old or imperfect methods of keeping track of work, and take these books into their shops for practical use.

Sent, prepaid, on receipt of price by

WE wish to call attention to the line of goods for which we are able at all times to quote most advantageous prices.

Our specialty is the manufacture of HIGH QUALITY ROOFING PLATES, and our Brands are known as the standard in their respective grades.

ROOFING TIN PLATE—BRANDS.

"Scott's Extra Coated".	"ABSOLUTELY THE BEST" 47 lbs. coating, and guaranteed to an extent unparalleled in the trade. Net weight, IC, 20 x 28, 240 lbs.
"Triumph Old Method".	Strictly Hand Dipped, Palm Oil process throughout, 38 lbs. coating. Greatly superior to other makers' best qualities. Net weight, IC, 20 x 28, 230 lbs.
"Protection Old Process"	A great favorite; bright clean finish, heavily mottled, 40 lbs. coating. Net weight, IC, 20 x 28, 230 lbs.
"Old Reliable Re-dipped"	Dull oil finish, well mottled, 36 lbs. coating. Very much preferred to the M. F. Brand, which is standard of best quality Welsh plate. Net weight, IC, 20 x 28, 230 lbs.
"Neville Old Style" . .	Very bright, clean and handsomely mottled, 26 lbs. coating, exceptionally rich in pure BLOCK TIN. Net weight, IC, 20 x 28, 220 lbs.
"Duquesne"	The highest standard of rolled roofing plates, has taken the position in America heretofore occupied by the foreign "Worcester" brand. Full weight.
"Pittsburg"	Next quality to Duquesne, and a favorite with many.
"Raymond"	A medium grade, suitable for ordinary work. Always sold at a very moderate price Full weight.
"Allegheny"	The lowest priced roofing plate we have to offer. You will be agreeably surprised at its quality, taking into consideration its low cost.

BRIGHT TIN PLATE—BRANDS.

"Finest" .	The very best Bright Charcoal Tin. Superb coating, perfectly cleaned, closely assorted. "Finest" in name and quality.
"Clifton" .	An excellent plate, well coated. "Melyn" grade.
"Furnace" .	Medium quality, regular and light weights, also special sizes for Heater Pipe.

"FINEST" and "CLIFTON" brands in IC to IXXXX, 14 x 20 and 20 x 28, and also in many odd sizes.

KEPT IN STOCK BY LEADING JOBBERS.

"1898"

How the years roll by, another century nearly completed. A century is a long period of time to look forward or back to How many of the tin roofs you put on in 1897 will last a century? None, unless they happen to be made from GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES. Not such a big statement to make when you remember that these plates are made exactly as the well-preserved plates found on very old roofs were made. Try a box in any hard place, watch them closely and see for yourself how they resist the decay to which other plates speedily succumb Then recommend them to your customers.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

GUMMEY, McFARLAND & CO., Philadelphia.

Send for Catalogue and Prices.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

PUBLISHERS AND BOOKSELLERS,

232-238 William Street, • NEW YORK.

—SURPRISED THE PRESIDENT.—They are telling a story here on a well-known Kentuckian, an applicant for office, who had arranged with his Congressman to be presented to the President.

"Give me a pointer or two about the etiquette," he said.

"Oh, it's simple," replied the Congressman. "You address him as 'Mr. President,' and then add anything pleasant and timely that may occur to you. He won't be able to give us but a few minutes, you know."

"I see he has taken to horseback riding. How would it do to mention that, and then refer to our own stock and express the hope that he may have a good mount?"

"No!" exclaimed the Congressman. "Whatever you do, don't talk horse; be easy and natural, but not conventional."

The man was presented to the President, when, to his great surprise, the President himself began to talk horse. But the Kentuckian, obeying his Congressman's tip, said next to nothing in reply on that subject.

A few days afterward the Congressman called alone at the White House, and the President said to him:

"What sort of Kentuckian was that you brought here the other day?"

"A tiptop one, sir." Why?"

"Why, I tried to talk horse to him, and he didn't seem to know anything about horses."

The Congressman was strongly tempted to tell the whole story, but as the joke was really on himself he kept his peace. But he is trying extra hard to get the man a place as a salve for his own conscience.—*Exchange.*

—WHAT funny people folks are! Bodge and Dodge meet.

Bodge—Hello! what's the news?

Dodge—Don't hear a thing; what is the latest thing with you?

Bodge—Nothing new. By-the-way, we had quite a fire down our way last night. Three persons killed and half a dozen injured.

Dodge—So? That reminds me that there was a collision on the Ruston and Gapper Railroad a little while ago. Qnite a number killed, I hear.—*Boston Transcript.*

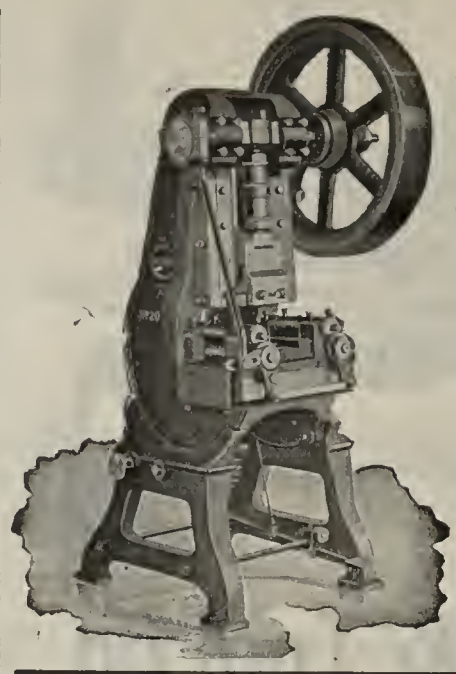
A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age*.

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.



The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID. $1.00.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

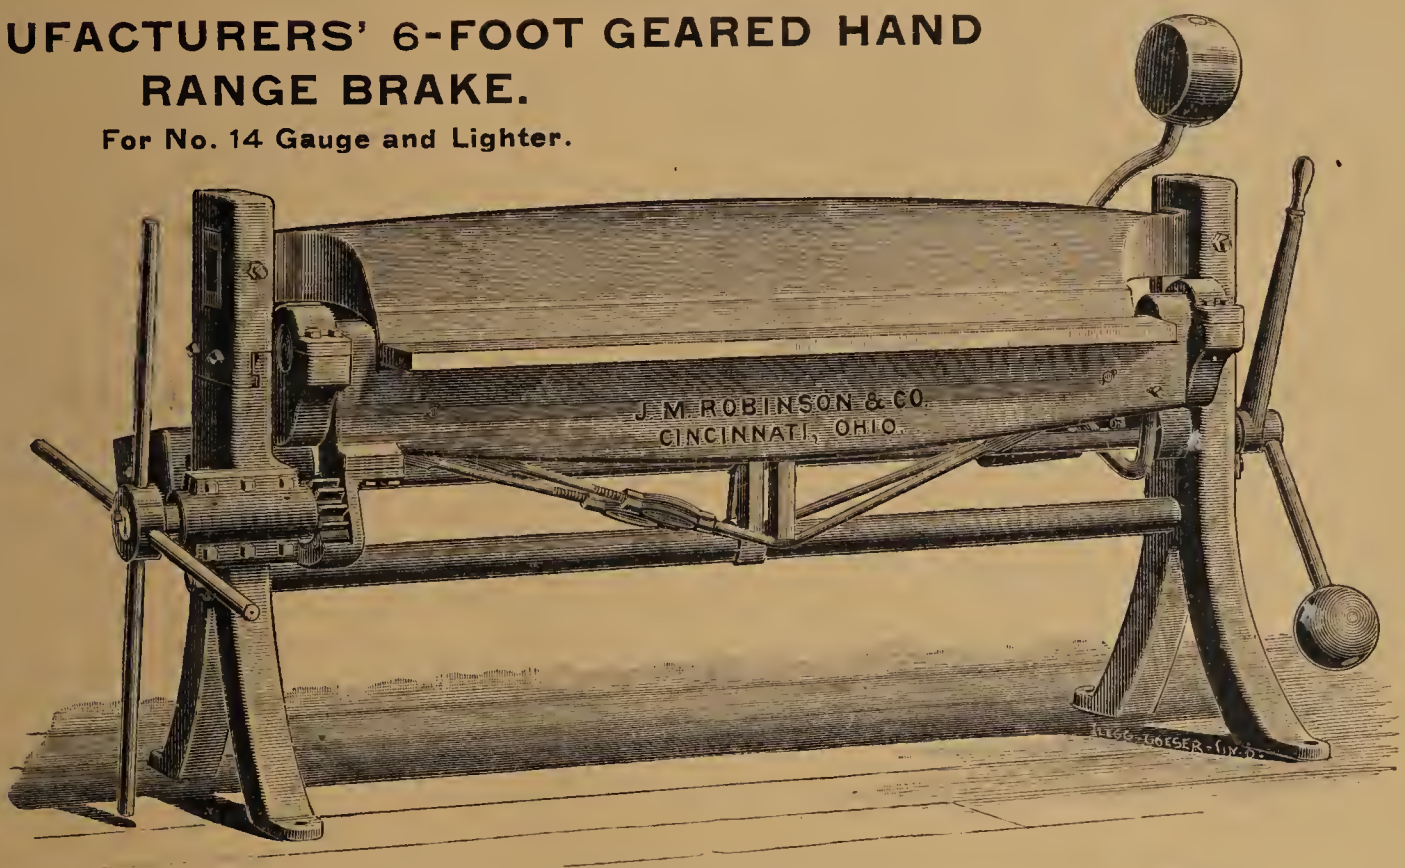
W. J. GORDON 218 New St., PHILADELPHIA, PA

—London Scene in the Sixtieth of Victoria.—A pathetic incident took place on the embankment in the early hours of Wednesday morning. Three men who had on the previous evening obtained a thousand wrappers each to address found themselves unable to raise the price of a lodging, and so as soon as the daylight was sufficient they began to work at fresco. Luckily they had pen and ink, and, squatted on a seat, they began to write, making a desk of their knees. More than once they were moved on, but they persevered, and by 10 o'clock they had each done 500 of the 1,000, for which they received 1s. 6d. apiece. They were then able to go to a lodging to finish their task, and have what no one will deny was a well-earned breakfast. As one of the men said: "We are used to it."—*London Daily News.*

RANGE BRAKES.

4-FOOT OPEN END RANGE BRAKE,

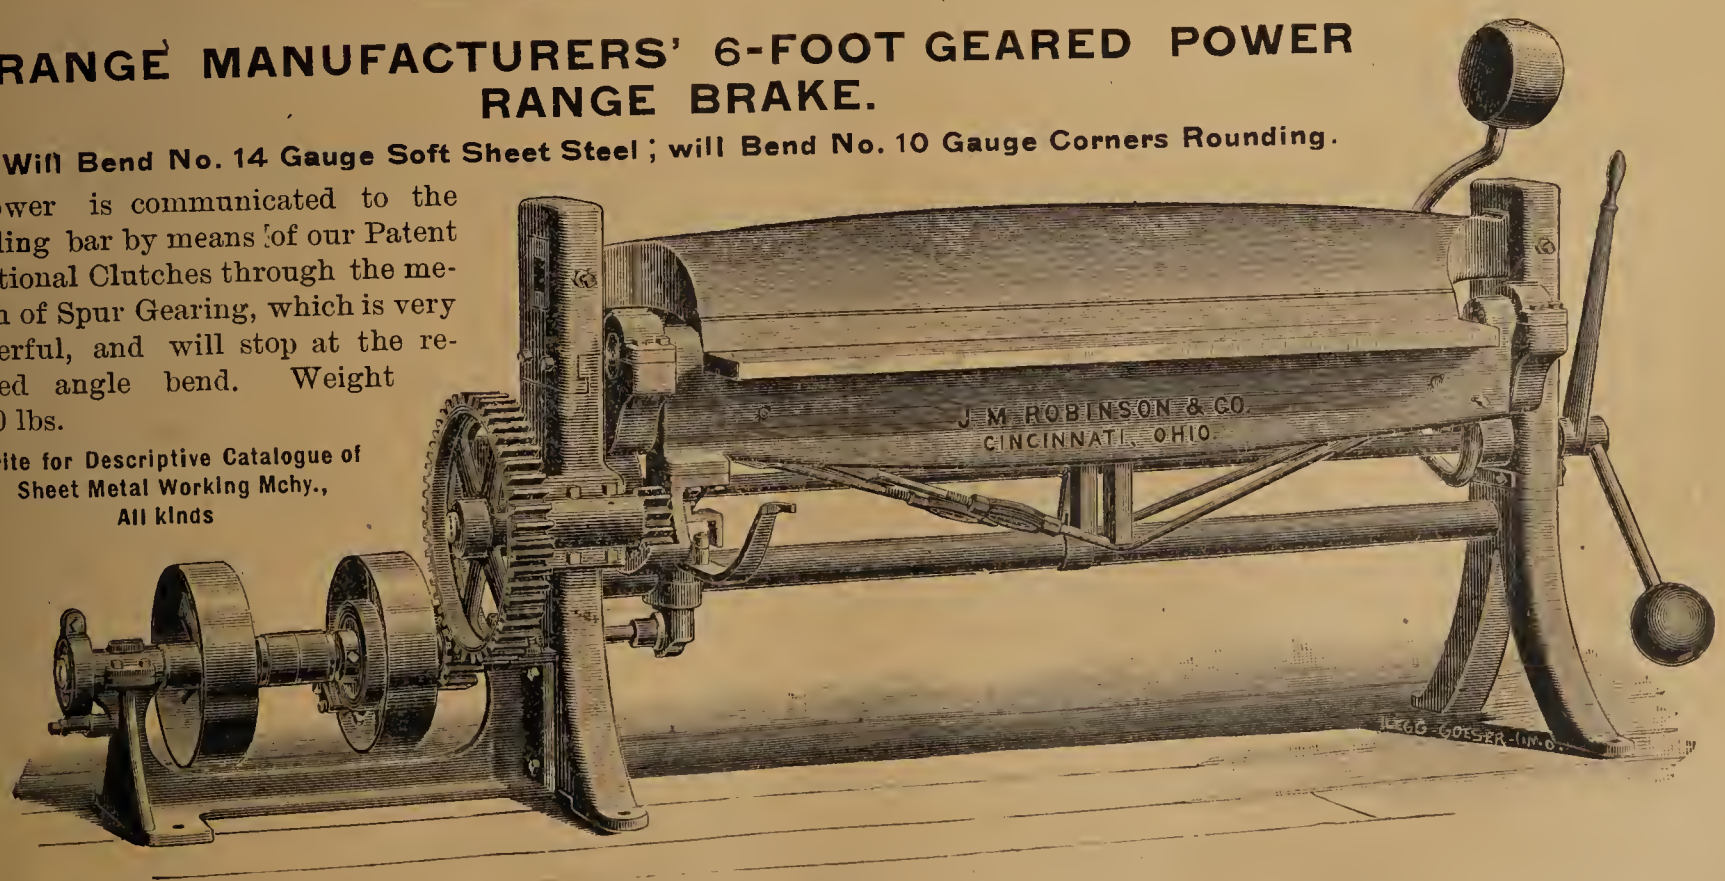


for bending a four-sided figure, and removing same from open end without marring its shape. Same brake will do all ordinary bending and flanging of No. 14 gauge and lighter in four lengths or less. A favorite with manufacturers of family ranges.

RANGE MANUFACTURERS' 6-FOOT GEARED HAND RANGE BRAKE.

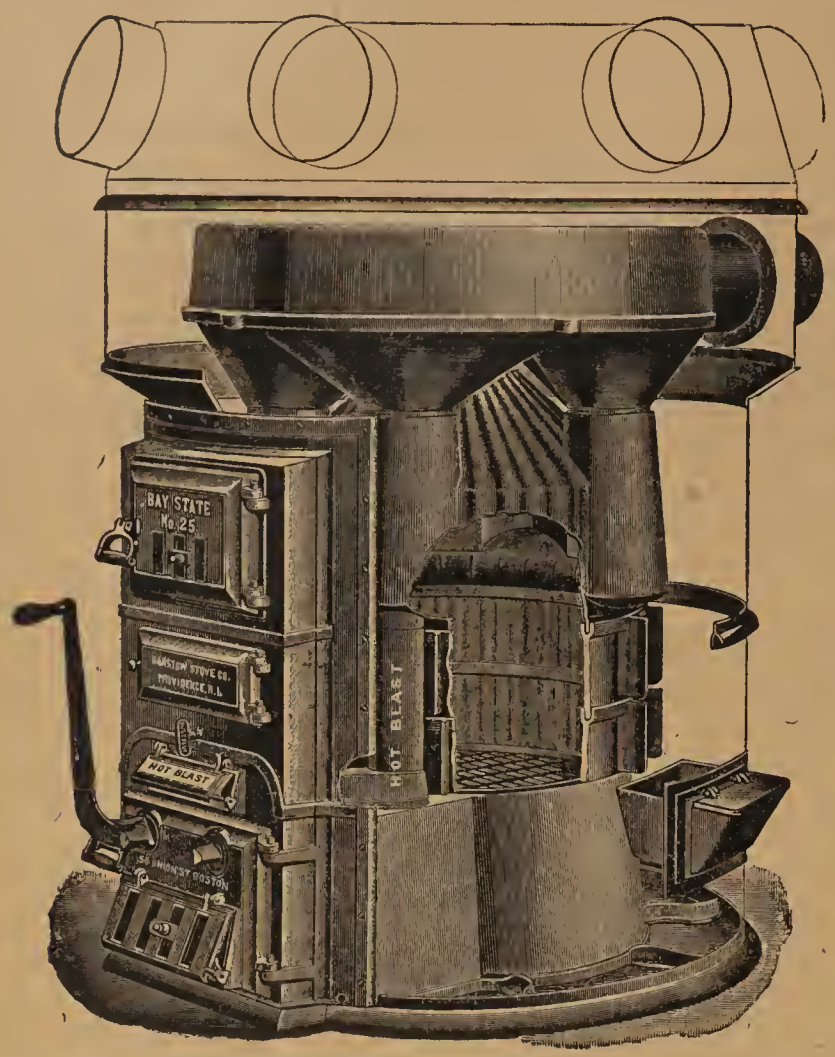
For No. 14 Gauge and Lighter.

Possesses all the features of the power brake made from the same patterns. Bending bar is operated with a pilot wheel, and imparts great power to the bending bar through the medium of spur gearing meshing into segment attached to the bending bar.



RANGE MANUFACTURERS' 6-FOOT GEARED POWER RANGE BRAKE.

Will Bend No. 14 Gauge Soft Sheet Steel; will Bend No. 10 Gauge Corners Rounding.



Power is communicated to the bending bar by means of our Patent Frictional Clutches through the medium of Spur Gearing, which is very powerful, and will stop at the required angle bend. Weight 4,500 lbs.

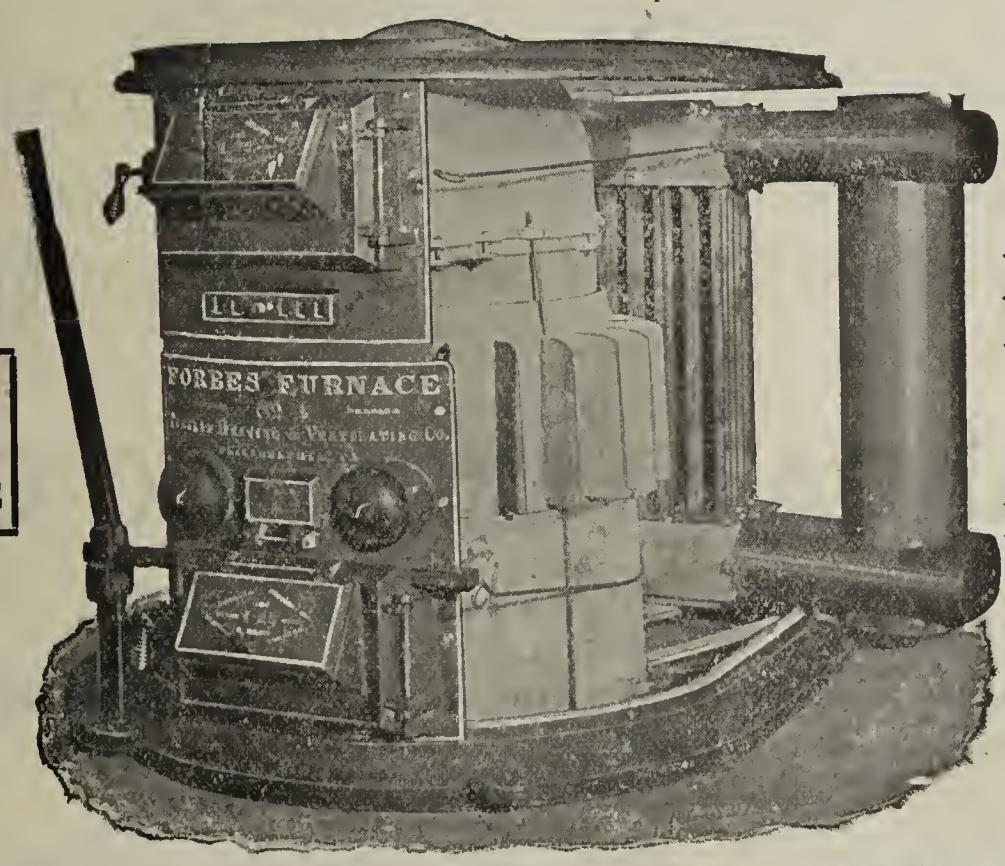
STOVES
UTICA, N.Y. U.S.A.

WHEN THE NEW YEAR COMES, LOOK OVER THE OLD YEAR'S BUSINESS.

If you haven't made money, look about you for a better line of goods.

TRY OURS.

If they don't make money for you, and satisfy you, by January 1st, 1899, then you will be the exception to the rule among our customers, and you had better look after your way of doing business, and not your goods.



THE FORBES WARM AIR FURNACE.

I. NEWTON EVANS,
REAL ESTATE,
HATBORO, PA.

TUESDAY AND FRIDAY,
221 SOUTH FIFTH STREET,
PHILADELPHIA.

HATBORO, PA., Dec. 26th, 1896.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR:
In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal.
Very truly,
I. N. EVANS.

DO NOT SPECULATE

IN

Cheap or Experimental

LINES OF

Vapor or Oil Cooking Stoves.

The average mortal has troubles enough of his own without buying those of his neighbor.

Speculation in any of the above mentioned lines will drain your purse and put you to a world of trouble.

Seeds of prudence now well sown in the selection of a line that is both complete and honest will yield a profitable and happy harvest. A good beginning for 1898 means half the battle won.

If you are interested in the handsomest line made, write for our catalogue.

TO ALL DEALERS IN "BLUE FLAME" OIL STOVES, GREETING.

This Company owns and controls fifteen Letters Patent, which in the expert opinion of our attorneys fundamentally cover all rights to manufacture "Blue Flame" Oil Stoves. In order to test their validity we have brought suits in the United States Circuit Court against the stoves made by certain manufacturers. We have granted licenses to manufacture to

The Cleveland Foundry Company Cleveland, Ohio.
The Dangler Stove & Mfg. Company, " "
The Standard Lighting Company, " "
The Schneider & Trenkamp Company, " "
The A. C. Barler Mfg. Company, Chicago, Ill.
The Quick Meal Stove Company, St. Louis, Mo.
The Monarch Stove Company, Mansfield, Ohio.
The A. J. Lindemann & Hoverson Company, Milwaukee, Wis.

We hereby notify the trade that, in the event our patents are sustained, we will ***collect damages*** from all parties selling "Blue Flame" Oil Stoves made by any manufacturer not licensed by us.

Respectfully

The United Blue Flame Oil Stove Company,

Cleveland, Ohio.

WE have the best and can prove it.

We are the Originators of Wickless Oil Stoves.

The Puritan Wickless

BLUE FLAME OIL COOKING STOVE.

It Burns the vapor—not the oil—hence no smell of oil.

The only stove ever made that burns either Coal Oil or Gasoline.

No Soot. No Smoke. No Odor. No danger of wrong fuel.

The simplest stove ever made. Only three parts to the burner, it cannot get out of order.

HIGH GRADE HEATERS.

Some Dealers Look to the profit they make on the sale of a single furnace, and if a cheap furnace is used the profit looks large when the contract

Is Made.

When this cheap furnace fails to heat, and gives out in the middle of winter, the dealer is obliged to alter and readjust the setting, secure repairs for his furnace, and in the end the entire profit

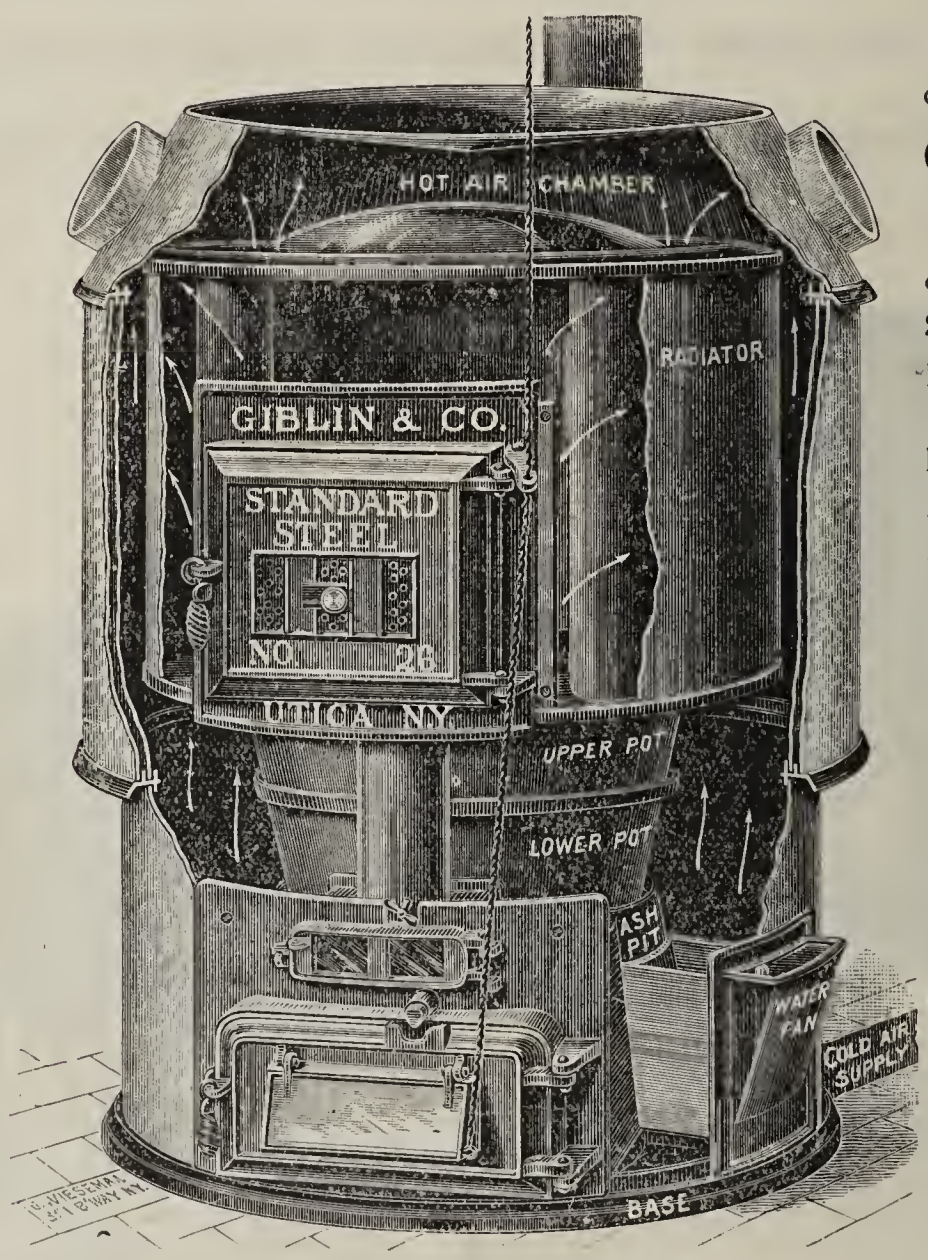
Is Wiped Out

and great disgust follows to both the purchaser and the dealer.

OTHER DEALERS INSIST

on using

GOOD MATERIALS, WORKMANSHIP, FURNACES.



The result of such choice is satisfactory heating, pleasant feelings between the purchaser and the dealer, and the

WARMEST RECOMMENDATION

of the furn ace and the dealer.

A GOOD BUSINESS REPUTATION

is obtained, and when good work is wanted this dealer is sought out and fair prices paid for his work.

The Basis

of all heating is a

Good Furnace,

one that is

SIMPLE in operation;

ECONOMICAL in fuel and

LONG-LIVED

without the need of repairs.

The furnace shown here has all these merits, and the actual use of

Many Thousands

of these heaters has demonstrated its superiority.

FURNACE DEALERS

who are trying to establish a

Good Furnace Business

should place themselves in communication with us, obtain our catalogue, see the line of heaters we make and get in position to do business on a good basis for the year 1898.

Our Prices are reasonable, and our treatment of our customers is

More Reasonable.

N. Y. OFFICE— OSWEGO, N. Y. —210 WATER.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

THE METAL WORKER ESSAYS
—ON—
HOUSE HEATING
—BY—
Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

THE NEW METAL WORKER PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given, 75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

After All Has Been Said

about the merits of different furnaces and after all that has been done to reach the highest pinnacle of perfection in their construction, there still remains certain well known and ascertained facts, certain principles of a distinctive quality which mark the one from the other as to their actual value and worth. It is this quality, this principle, that is shown which we talk about and prove.

About The Best

furnace we know of is the one shown in the above cut. As every dealer knows, every manufacturer of furnaces makes the same claim. That's business. But granting that every furnace made heats, the economical feature is in many instances lost sight of. The most practical illustration of fuel saving is concentrated in the two hollow radiators which encircle this particular style of furnace.

The Business Situation.

The first week of the new year is not, as a rule, fruitful of noteworthy occurrences in the world of business. Stock taking and the making up of books largely engross the energies of those engaged in trade and commerce. Merchants and consumers are not ready to place new orders for goods until they have measured their requirements by the results of the annual inventory, and the volume of current business, therefore, is apt to be light. The past week was no exception to this rule. Business in general was quiet, and there are few or no changes to record. In the absence of active demand for goods, prices have remained stationary in almost all lines, the principal exception being in the iron and steel trade, where an advance is reported in some forms of finished material, notably in steel billets and wire rods. The metal trade has been dull throughout. In the speculative markets narrow and "professional" trading was the rule, with values somewhat irregular, as is usual while the January settlements are in progress. The tone of nearly all the markets, however, at the close of the week indicated the expectation of an early return of strength and activity. Exports have continued in good volume, and the development of a large and brisk movement of goods at home is looked for as the month progresses. As compared with the outset of 1897 the conditions affecting general business at the present time display a radical change for the better. The distrust and uncertainty which prevailed a year ago have passed away and given place to confidence. Magnificent harvests last year have revolutionized the business situation in the West and the improved status of the community there is reflected in the East also. Long idle mills and factories have been reopened and employment given to thousands of additional workers, so that the opening of 1898 finds the army of labor more fully employed than at any time since the panic of 1893. The railways are making phenomenal strides toward prosperity, in steadily increasing earnings. A number of important railway reorganizations have been effected, and many roads have returned to the ranks of dividend payers. The Treasury gold reserve has swelled to almost unprecedented proportions, reaching about $160,000,000 at the close of the year, and removing all fear of any serious gold shortage for some time to come. The revenues of the Government, too, have begun to show improvement, December's receipts leaving a surplus of $1,736,500 over expenses, the first for a long period.

Business Failures in 1897.

One of the most satisfactory features connected with the business of the past year is the fact that its record of business failures in the United States showed a decided falling off as compared with 1896, alike in number and in liabilities of the individuals or firms succumbing to the pressure of unfavorable circumstances. The figures compiled by *Bradstreet's* place the total business mortality of 1897 at 13,099, a falling off of more than 2000 failures or 13.3 per cent. compared with 1896 and of 15 per cent. from 1893, the first year of the recent business depression. The liabilities of those failing last year make a still more favorable showing. They constitute one of the smallest totals of recent years, amounting to only $156,166,373, a decrease of 37 per cent. from 1896 and of no less than 60 per cent. from 1893. These figures indicate a gratifying return to normal conditions in general business during the year just closed, particularly as the tendency to improvement became more pronounced as the year progressed. The decline in failures, moreover, was general throughout the country, with the exception of the New England group of States, which show an increase of nearly 200 failures and of over $6,000,000 in liabilities compared with the previous year. This poor showing is attributed mainly to the failures of several large cotton mill corporations, which in their collapse pulled down other individuals and concerns with them. The Middle, Western and Northwestern States make excellent showings in the decreased number of commercial embarrassments reported. The Southern States also display improvement over 1896, notwithstanding the depression caused in that section by floods in the early part of the year, the yellow fever scourge in the latter half of the year and a sharp decline in the price of cotton. The total number of Southern failures was the smallest since 1891. A lesser decrease both in failures and in liabilities is shown by the Pacific Coast States, while the Territories had a slight increase in the number of failures, but a decline of about 60 per cent. in the liabilities of those failing.

The 1897 Fire Losses.

The past year was one of the most satisfactory from the point of view of the fire insurance companies that they have ever experienced, for a combination of increased rates and reduced losses made their profits more liberal than in several years past. The increased efficiency of urban fire departments and improvements in fire fighting appliances, together with the better precautions taken against fire in modern buildings which have come in during the past few years, are reflected in a steady decline in losses from this cause, notwithstanding the growth of population and the increase which has taken place in the number of buildings. According to the figures published by the New York *Journal of Commerce*, the total fire

losses of the United States and Canada for 1897 amounted to $110,319,650, a large enough sum, it is true, but smaller by $5,000,000 than the losses for 1896, and $19,500,000 below the 1895 figures. Several very large fires swelled the total for last year, there being no less than 22 cases where the loss exceeded half a million dollars. Otherwise the figures would have been more favorable than they are. But the fact that the losses in smaller fires were very much less in amount than in previous years is gratifying, and speaks well for the improvement which is taking place in the matter of fire protection. The most notable fires of the year were the burning down of a dry goods store and a number of business houses in Pittsburgh, Pa., with a loss of $2,300,000 ; the destruction of railroad piers and shipping property at Newport News, Va., involving a loss of $1,500,000 ; of a large dry goods store at St. Louis, Mo., with $1,300,000 damage; of several business buildings at Knoxville, Tenn., at a loss of $1,000,000, and a destructive fire at Windsor, N. S., which did a damage of $1,250,000. Besides these seven large conflagrations at Philadelphia, Harrisburg, Pa.; Hoboken, N. J.; Washington, D. C.; Detroit, Mich.; Grand Forks, N. Dak., and Chicago, each accounted for a loss of $750,000 or over. Among the notable structures destroyed by fire last year were the Pennsylvania State Capitol Building at Harrisburg, the Coliseum Building at Chicago and the Immigration Bureau buildings at Ellis Island, New York City. Two fires of extraordinary destructiveness occurred abroad during the year, one in London, England, and the other in Melbourne, Australia, each involving many millions of dollars of loss, and each destroying a large area in the business centers of those cities. The antiquity and inefficiency of the fire fighting methods in both London and Melbourne, as compared with the systems in vogue in this country, were strikingly illustrated in these disasters.

The Philadelphia Exposition of 1898.

A charter has been issued to the Philadelphia Exposition Association, a corporation who are to manage the affairs of the Exposition of Manufacturers of the United States to be held in Philadelphia next October under the joint auspices of the Philadelphia museums and the Franklin Institute of that city. The incorporators, who will also form the first Board of Directors, are P. A. B. Widener, who will be the president of the association; William L. Elkins, John Birkinbine, John H. Converse, Edwin S. Cramp, Thomas Dolan, Dr. William Pepper, Mrs. Sara Yorke Stevenson, A. B. Farquhar, W. W. Foulkrod, J. C. Strawbridge, William P. Wilson, Daniel Baugh, Sydney L. Wright, Joseph S. Harris, Louis J. Matos, William M. Watts, Wilfred H. Schoff, John R. Savage, C. A. Green, G. H. Leaf, A. Sydney Millward, Henry C. Corfield, E. H. Barclay and Arthur Brock. The working force of the organization will be organized immediately, and all preparations pushed forward with vigor. It is intended to erect a main building on ground in West Philadelphia donated by the city to the Philadelphia Museums for the erection of permanent buildings. The main building will be constructed in such a manner that it may be subsequently used for the Philadelphia Museums. Other temporary buildings will be put up also The capital stock with which the association starts is placed at $300,000.

A statement prepared by the Navy Department at Washington places the property value of the various navy yards and naval stations of the Government at over $60,000,000, of which $54,000,000 represents the value of real estate and chattels and $7,000,000 that of machinery. The navy yard at New York is estimated to be worth a little more than $16,000,000 and that at Boston between $10,000,000 and $11,000,000. The Norfolk Navy Yard is valued at $6,000,000 and that at Mare Island at $5,500,000. The ordnance factory at Washington is valued at $7,000,000. including plant and everything complete for the manufacture of great guns. The League Island Navy Yard is estimated to be worth $3,500,000; the Portsmouth yard, $3,100,000; that at Pensacola $2,000,000, and the new naval station at Puget Sound $800,000, while the valuation of the Naval Academy grounds is placed at about $800,000.

Changes in the Patent Laws.

Howson & Howson of Philadelphia have issued the following statement with reference to the important amendments recently made to the patent laws :

1. A radical change is made in Section 4887 of the Revised Statutes, affecting the interests of those taking out, or desiring to take out, foreign patents. The section, as revised, reads as follows (the new parts being printed in brackets):

"Sec. 4887. No person [otherwise entitled thereto] shall be debarred from receiving a patent for his invention or discovery, nor shall any patent be declared invalid, by reason of its having been first patented or caused to be patented [by the inventor or his legal representatives or assigns] in a foreign country [unless the application for said foreign patent was filed more than seven months prior to the filing of the application in this country, in which case no patent shall be granted in this country]."

It will be seen that the long standing requirement that "every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent" will be abolished, so that all patents granted under the new law will run for the full term of 17 years. Furthermore, under the new law, an inventor can apply for his foreign patents without waiting for the allowance of his U. S. application, or arranging for the issuance of his U. S. patent. In fact, he can file his foreign applications simultaneously with, or even before, the filing of his American application. On the other hand, there has been added a limitation, whose practical effect will be to cause a foreign patentee to forfeit his right to a U. S. patent unless he shall file his American application within seven months after the filing of his foreign application.

2. A new defense can be set up to an action for infringement of a patent granted under the new law, namely : "That it (the invention) has been patented or described in some printed publication . . . more than two years prior to his application for patent therefor." Such two years' prior publication or patenting of an invention will bar the grant of a valid patent for the invention under the new law. (Sec. 4886 and Sec. 4920, R. S.)

3. Under the law as amended, the time within which an applicant for a patent is required to proceed with his application in the Patent Office is reduced from two years to one year after any official action thereon. (Sec. 4894, R. S.)

Note.—The act provides that the above-mentioned amendments "shall not apply to any patent granted prior to January 1, 1898, nor to any application filed prior to said date, nor to any patent granted on such an application."

4. The act of March 3, 1897, also put in force a Statute of Limitation, as follows :

"But in any suit or action brought for the infringement of any patent there shall be no recovery of profits or damages for any infringement committed more than six years before the filing of the bill of complaint or the issuing of the writ in such suit or action, and this provision shall apply to existing causes of action." (Sec. 4921, R. S.)

A Public Accountant.

An innovation has been made by the American Tin Plate Company of Chicago in employing a public accountant to certify the correctness of the calculations in their recently published ratio and code book. George Wilkinson, whose certificate appears in the ratio book, is an Englishman, and the son of an accountant. His first experience in this country was in January, 1887, with the old established firm of Veysey & Veysey, public accountants, New York. After a trip to China, to remodel the accounting of a large trading concern in Shanghai, he was engaged in March, 1890, by the well known firm of chartered accountants, Barrow, Wade, Guthrie & Co., and was placed in sole charge of their Chicago branch. In this responsible position he remained until April 1 last, when he began to practice in his own name with offices in the Royal Insurance Building, Chicago, and in the Johnston Building, New York.

A new law, which went into effect on January 1, limits the production of goods in the workshops of the Massachusetts penal institutions, so that not over 30 per cent. of the inmates of any one prison shall be employed in any single industry, except cane seating and the manufacture of umbrellas.

THE LETTER BOX.

Capacity of a Centrifugal Pump.

From A. G. Adelman, Boise, Idaho.—I would like to know if I could get a description or name of a pump that will draw water 100 feet vertically and discharge 50 miners' inches continually, and what would be the necessary horse-power to run it smoothly. I have a centrifugal pump that has a 4-inch discharge and would like to know if it could be used to do the work advantageously and the necessary horse-power to run it.

Answer.—We will be glad to have pump manufacturers send word to Mr. Adelman of the pumps they make that meet his requirements. It will require, theoretically, 15 horse-power to raise 50 miners' inches of water (75 cubic feet) per minute to a hight of 100 feet. The friction of pump and water in pipe will require about 5 horse-power additional, or, say, 20 horse-power in all. If you are to draw the water from a deep well a deep well pump must be used, the lifting bucket of which must be located at the natural water level of the well, so that when the water level falls by pumping the suction distance may not exceed 25 feet at any time. A centrifugal pump cannot be used for deep wells nor for a hight of 100 feet. The speed required is very great, with no economy as to power. If the well is an open one in which a direct acting steam pump can be placed within 20 feet of the surface of the water, it will be the best and most economical method of pumping. If it is a bored deep well a vertical direct acting lift pump, with the bucket chamber well down below the water line, is the best method. In either case a 20 horse-power pump and boiler will be required. If nearby power can be obtained conveniently for compressing air the Pohlé air lift system may be applied to a deep bored well to great advantage and it requires no attention whatever at the well. The operation of the compressor at the power house requires but little attention from the engineer.

Asbestos Lined Portable Sheet Iron Stove.

From W. T. Twitmire, Bellefonte, Pa.—Is there such a thing as a sheet iron stove with asbestos lining and made so that it can be taken apart and packed in a small space? I have an order for some for the Alaska mining country and would be glad if *The Metal Worker* or some of its readers would tell me if there is such a stove and where I could get it.

An Explanation of Hood's Tables.

From T. H., N. Y.—On page 471 in Hood's book on heating and ventilation, edition of 1894, I find that a difference of temperature in a ventilating flue of 5 degrees (flue 10 feet high) gives a velocity of 116 feet per minute, as I understand it. In table of velocity of chimney drafts, external air 32 degrees and temperature of warmed air 86 degrees, a difference of 54 degrees, the relative velocity is represented as 4.93. There seems to be no explanation and I cannot understand it, though I suppose it will be all clear when the proper key is applied.

Answer.—We submitted the above inquiry to Prof. J. H. Kinealy of Washington University, St. Louis, Mo., who furnishes the following comments: The first table referred to, that on page 471 of Hood's book, gives the velocity in feet per minute of the air entering or leaving the shaft, and is calculated upon the assumption that about one-quarter of the total draft head is lost in friction. It is also supposed that the air does not change in volume in the shaft; the volume that enters at the bottom per minute is the same as the volume that leaves at the top per minute. The formula used is

$$v = 16\,45\ \sqrt{h\,(t_1 - t_2)}$$

v is the velocity in feet per minute of the air in the shaft; h is the hight of the shaft in feet; t_1 is the temperature of the air outside, about 32 degrees F.; and t_2 the temperature of the air in the shaft, which is supposed to be about the same as that of the air in the room; $t_1 - t_2$ is what is called, in the table, "excess of temperature of air entering the ventilating shaft above the external air."

The second table, entitled "Velocity of chimney draft at different temperatures, the external air being at 32 degrees F.," gives the velocity in feet per second of the cold air entering the chimney. In making this table it was supposed that a pound of the cold air entering the furnace at the base of the chimney and a pound of the hot gases flowing out the top of the chimney would occupy the same volume if reduced to the same temperature, and that the area of the opening for the entrance of the cold air into the furnace is the same as that of the smallest cross section of the chimney. The velocity of the entering cold air may be much less than that of the escaping hot gases, because the air is heated in the furnace, and therefore occupies a much greater volume in the chimney than it did outside, and the volume of gas that flows out of the chimney per second is much greater than the volume of cold air that enters per second. To illustrate this, let us determine the number of cubic feet of cold air at 32 degrees F. that must flow into a furnace per second in order that 10 cubic feet of hot gas at 320 degrees F. may flow out the chimney per second. Upon the assumption that the cold air and the hot gases will have the same volume at the same temperature, it is evident that the volume of cold air at 32 degrees F. that must flow into the furnace per second is equal to the volume that would be occupied by 10 cubic feet of gas when cooled to 32 degrees F. from 320 degrees F. The volume that would be occupied by the 10 cubic feet of gas, if cooled to 32 degrees F., is

$$\frac{10\ (461 + 32)}{461 + 320} = \frac{10 \times 493}{781} = 6\ 31 \text{ cubic feet.}$$

That is, only about 6.3 cubic feet of cold air enters the furnace at the base of the chimney for every 10 cubic feet of hot gases that goes out of the top of the chimney. Therefore the velocity of the entering cold air is but about 0.63 of the velocity of the hot gases escaping from the top of the chimney. I think that the table is intended for chimneys between 15 and 20 feet high, and is calculated upon the supposition that about one-half of the total draft head is lost in friction. The formula used in calculating the table is, probably,

$$V = \frac{368\ \sqrt{t - 32}}{461 + t}$$

V is the velocity in feet per second of the entering cold air, and t is the temperature in Fahrenheit degrees of the gases in the chimney.

Barn Roof Sweats.

From E. G. Washburne & Co., New York City.—In *The Metal Worker* of December 18 is a letter from "M. B.," Baraboo, Wis., giving an account of the condensation on the under side of a barn roof. We would state that a rotary ventilator in the roof would prevent the moist air from accumulating under the roof to leave a deposit in the form of water. We use a great many ventilators for this class of work and have just completed a job on a brewery at Elizabeth, N. J., where the vapor and steam from the malt is successfully cleared from the building.

SHEET METAL WORK.

SLATE AND COPPER ROOFING ON FIRE PROOF BUILDINGS.—V.

BY WILLIAM NEUBECKER.

SLATING IN COPPER DORMER OR BULL'S-EYE.

Fig. 24 shows the method of placing flashing around a bull's-eye dormer, previous to slating in the roof. We will assume that the slating has been carried up as far as shown by the dotted line F. Let K represent the window opening and A the copper curved molding, over which the copper roof J is placed in the shop, cut to the required pitch. G is the flange formed direct to the sill S, and connected, as shown, to the 8-inch flashing H, which is soldered firmly and water tight to the roof J. A water lock starting at L all around the flashing at M and N is made

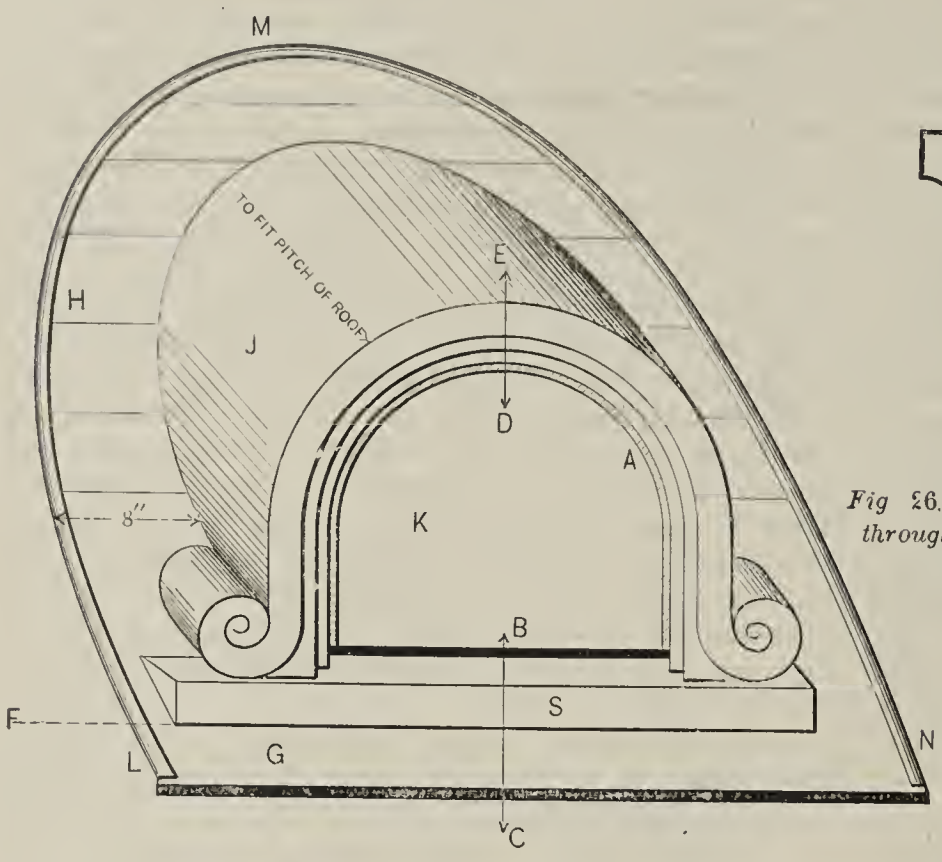

Fig. 24.—Showing Method of Flashing Around Bull's-Eye Window

the metal sill shown at G. The wooden sill N, which has a corresponding rabbet, J, cut into it to fit over the metal rabbet G, is set over the copper sill and forms a water tight joint. Likewise in Fig. 26 is shown an enlarged section through D E in Fig. 24, showing the method of obtaining a water tight joint between the copper molding and wooden sash. Let A, Fig. 26, be the copper molding, having a flange attached as shown at B, indicated in Fig. 24 at A. C, Fig. 26, represents the wooden sash on which the flange B is nailed and then covered by means of the wooden molding F, which makes a water tight joint.

FASTENING RIDGES ON FIRE PROOF ROOFS.

Let A A in Fig. 27 represent the roof beams, on to which the angle iron are bolted and filled with fire-proofing, as

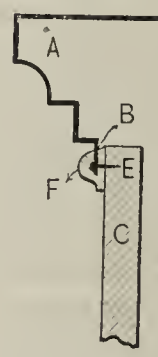

Fig 26.—Enlarged Section through D E in Fig 24.

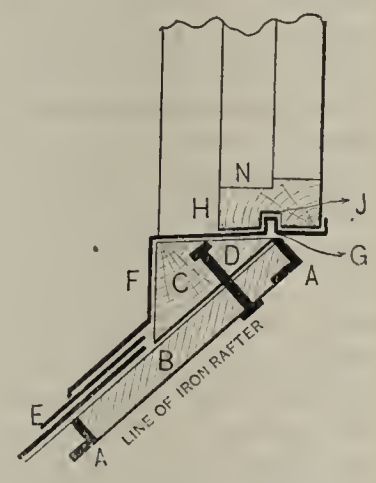

Fig. 25 —Enlarged Section through B C in Fig. 24.

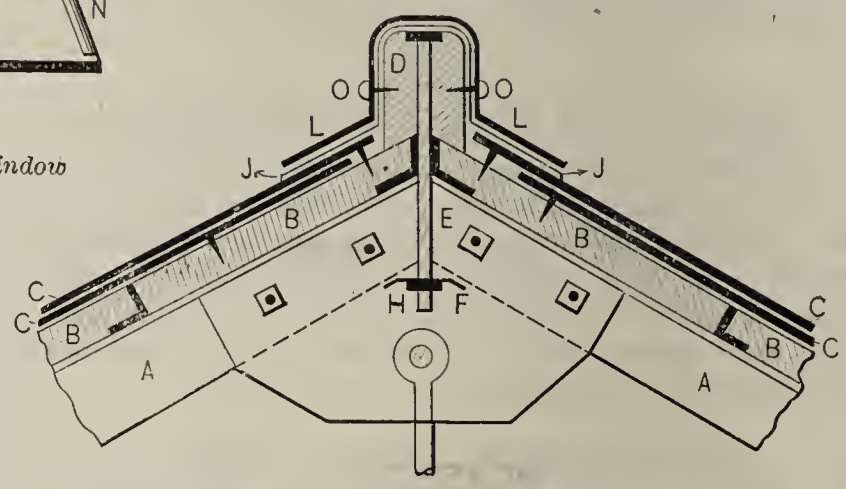

Fig 27.—Section through Ridge and Copper Covering.

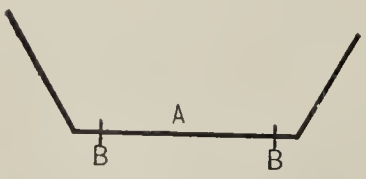

Fig. 28.—Clamp with Ends Bent.

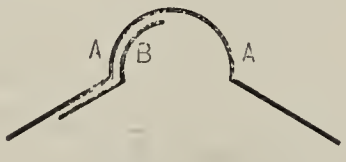

Fig. 29 —Brass Clamp and Iron Model

as shown. The window being prepared in this manner, it is now set over the slate line F and the slating continued around the roof J, which makes a water tight finish.

Fig. 25 is an enlarged view through B C in Fig. 24, showing the method of obtaining a water tight joint between the copper and wooden sill of the window. A A in Fig. 25 represent the angle irons on which the terra cotta blocks are laid, the wooden sill C being bolted as at D by the framer through the blocks. The wooden sill is cut to correspond in size and shape to the copper sill S in Fig. 24. The sill C, Fig. 25, being in position, let E be the last course of slate butting against the wooden sill C ; the copper sill F H is now placed over the wooden sill, with the flange covering the last course E and a rabbet formed in shown at B B, &c. C C show the slating butting against the wooden ridge roll D, which is placed in position by the framer, by means of the bolt E, and fastened at the inside by means of a washer and nut. J J show the copper ridge, which is placed over D, flashing over the slates and covering the nail heads. To prevent the wind from tearing up the ridge roll, brass clamps L L made of 3-16 x 1¼-inch band brass are placed over the copper ridge and fastened by brass screws O O.

If a number of changes are to be made to fit the ridge, the first step is to get the required stretchout, cut off all the lengths of brass, punch and countersink the holes, so that they will come in the position shown at O O, and bend the flanges at their proper angles, as shown in Fig. 28, in which B B are the holes, countersunk on the side

A. The clamps being made of soft brass, they are bent cold, using a little device shown by B in Fig. 29. In the shop it is called a gauge and is made of ¼ x 1¼ inch band

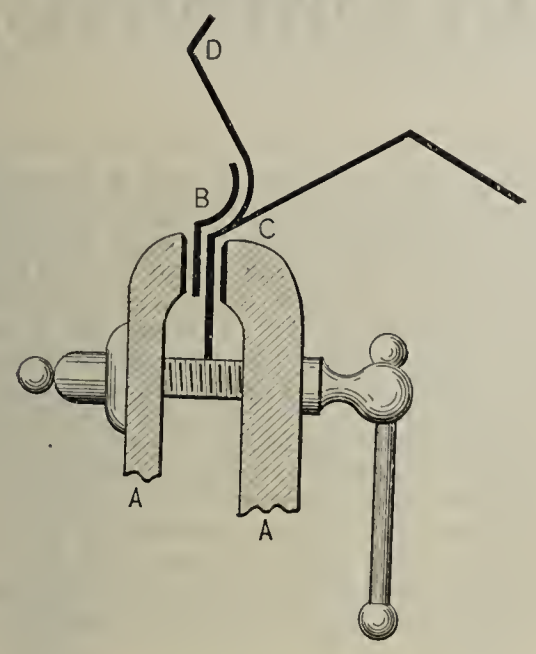

Fig 30—First Operation in Bending Clamp

iron having the required angle and one-half the profile of the ridge.

In Fig. 30, A A is a vise, B the iron gauge above referred to and C the brass clamp with angles already bent. Draw over the clamp C into the position shown by D for

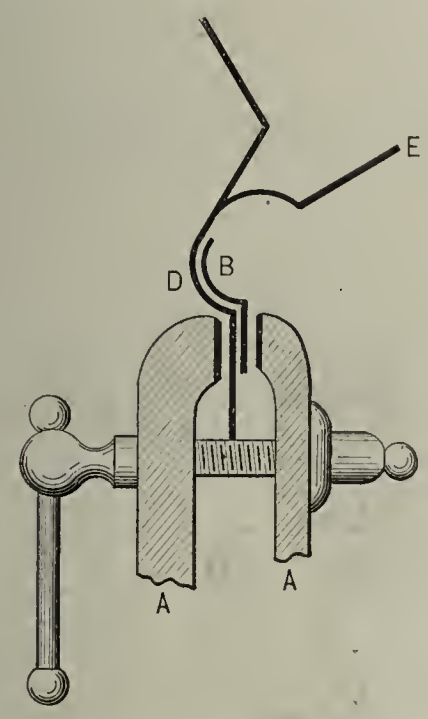

Fig. 31.—Second Operation in Bending Clamp.

the first operation. The second operation is shown in Fig. 31, in which D is the partly finished clamp, which is drawn over by hand to the position shown by E.

FLASHINGS.

James A. Coe & Co., Newark, N. J., send a New Year's greeting to their friends in the trade on a prettily decorated postal card.

The Newport Rolling Mill Company, Newport, Ky., manufacturers of Steel and Galvanized Sheets, advise us that they put out the largest tonnage in 1897 that they have ever had since the mill was started. Two new mills were added to their equipment during the year and the whole plant ran most successfully for 48 weeks, with fewer breakages and accidents than in any previous season. The company are looking for a larger and more profitable business in the present year than ever before and are amply prepared to meet it.

Joseph F. Annear, formerly of the firm of Carpenter, Annear & Co., but lately superintendent of the Bourlier Cornice & Roofing Company, Louisville, Ky., died in that city after a brief illness December 27, his death being due to a carbuncle. Mr. Annear had been in the cornice and roofing business in Louisville for the past 27 years, and was very highly esteemed by all who knew him for his kindness and integrity. Out of respect to his memory the Bourlier Cornice & Roofing Company closed down their works and attended his funeral in a body, the interment being in Cave Hill Cemetery. He leaves a widow and two children.

A finely colored print of a brook trout in the process of being taken from his home is the decorative feature of an attractive calendar distributed by George B. Blizzard, tin and sheet iron worker, 108-110 Manton street, Philadelphia, Pa. Other work done by Mr. Blizzard includes erecting and repairing Heaters and Ranges, Galvanized Iron Work, Blast Pipes, &c.

David Lupton Sons, 2613 Coral street, Philadelphia, Pa., have recently completed the sheet metal work on Piers 22 and 24, South Wharves, Philadelphia. These piers are 100 feet wide and 500 feet in length. In addition to the Corrugated Galvanized Iron Siding used, which amounted to three carloads. there were 54 Skylights having ½-inch glass and 28 36 inch Star Ventilators. The firm now have the contract for similar work on Pier 25, North Wharves. The firm also make a specialty of the manufacture of Conductor, Eave Trough and Conductor Elbows, Shoes and Fittings. They have recently added to their well equipped factory a galvanizing department, enabling them to galvanize Sheet Metal Work, which they manufacture, and also to do galvanizing for the trade.

The stock of the Iron City Mfg. Company, manufacturers of Steel Ceilings, whose works are located at Twenty-third and Mary streets, S. S., Pittsburgh, has been purchased by Jno. C. Graff of the Graff Roofing Company of Pittsburgh, who will reorganize the business of the Graff Roofing Company and Iron City Mfg. Company under the charter of the latter concern, and the name retained will be Iron City Mfg. Company, of which Jno. C. Graff is president. The new company will manufacture all kinds of Iron and Steel Roofing, Metal Shingles and Steel Ceilings, and will be pleased to have the inquiries of the trade.

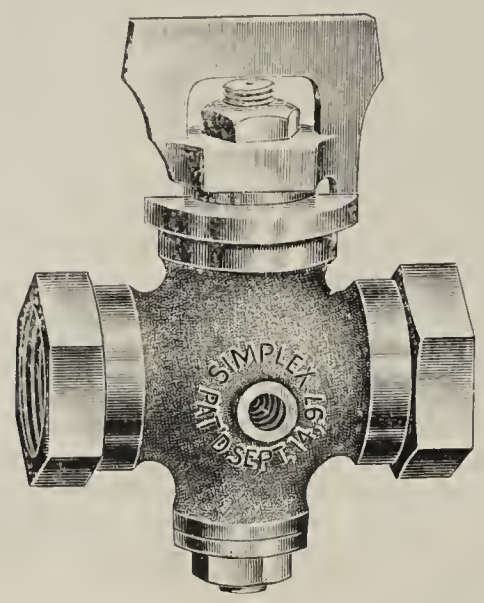
The Vinton Steel Works, manufacturers of Sheet Steel Ceilings and other sheet metal specialties, who have lately been reorganized, with several new stockholders, elected the following officers recently: President, S. E. Keith; vice-president. J. B Sanders; secretary, S. H. Metcalf; treasurer, Matt. Gaasch. The company, it is reported, will put in considerable new machinery, and with the aid of the new capital will be able to push the business on a much more extended scale.

A very neat calendar has been received from the Boss Tin Shop, Bonaparte, Iowa. It is destined to be hung on the wall, having a good sized cardboard back, embossed in gilt and enlivened by a taking picture of three kittens.

The partnership lately subsisting under the name of W. Austin Obdyke & Co., Philadelphia, expired on December 31, 1897. The business will be continued by Benjamin P. Obdyke.

The annual meeting of the stockholders of the Simmons Hardware Company, St. Louis, was held Monday, January 3, and the election of officers resulted as follows: President, Wallace D. Simmons; first vice-president, J. E. Pilcher; second vice-president, H. M. Meier; third vice-president, J. E. Smith; fourth vice-president, S. Norvell; traffic manager, F. N. Johnson; treasurer, A. E. Dann; assistant treasurer, G. R. Barclay; Secretary, A. W. Douglas; assistant secretary, E. H. Simmons; Advisory Board: E. C. Simmons and I. W. Morton.

Arthur Howes of Weymouth, Mass., has devised a collapsible house of aluminum, for the use of prospectors in the Klondike. The roof and walls are made of sheet aluminum 1-32 inch thick and the frame is of cold drawn steel bicycle tubing. Its interior dimensions comprise 180 cubic feet of space, and the house complete. when packed for transportation, weighs only 110 pounds. An order for a large number of these houses is reported to have been placed at Pittsburgh. They are to be shipped to Seattle as fast as completed.



Secretary Long of the Navy has asked permission from Congress to consolidate a number of naval appropriations, aggregating $54,000, with the idea of building a 5000 ton coal shed at Key West, Fla. The project is the first step toward making Key West a naval rendezvous It is proposed to put up a fire proof structure containing appliances for coaling vessels by the most economical and rapid mechanical means.

A decision of great interest to the users of natural gas was handed down this week by Judge Fox in the Wayne County Circuit Court of Indiana. Charles H. Glawson brought suit to enjoin a company from cutting off his supply of gas because he refused to comply with a new order of the company fixing one price for gas used for heating and another price for that used for illuminating. Judge Fox held that the company must make their rate uniform.

HEATING AND PLUMBING.

The Simplex Stop and Waste Cocks.

In the accompanying illustrations we show the Simplex stop and waste cocks made by Landers, Frary & Clark, New Britain, Conn. The stop cock is made of steam metal, thoroughly ground and tested to 200 pounds pressure. Special attention is called to the character of the castings, and the proportion of the cock is said to provide strength where it is needed to stand the strain. A general view is presented in Fig. 1 of the cock arranged to be opened with a key or wrench. Fig. 2 is a sectional view showing the construction and a lever attachment for use when the cock is placed where it is readily accessible. Fig. 3 is a view showing the cock without the lever for operating it, and showing a stud on the key which is directly over the waste hole in the key and arranged to limit its motion to one-half of a circle. It is pointed out that by simply changing the lever to operate the key from one side to the other the cock may be made a right or left hand cock, as desired. By this means it is impossible to set the cock wrong, as the lever will be parallel with the pipe when it is open and at right angles when it is closed. When it is closed and the lever at right angles the waste opening in the key will always correspond with the waste opening in the cock. With the pressure of water from the service pipe closed off this will allow the water in the piping on the other side of the cock to waste away.

The Simplex Stop and Waste Cock.—Fig. 1.—General View of the Cock.

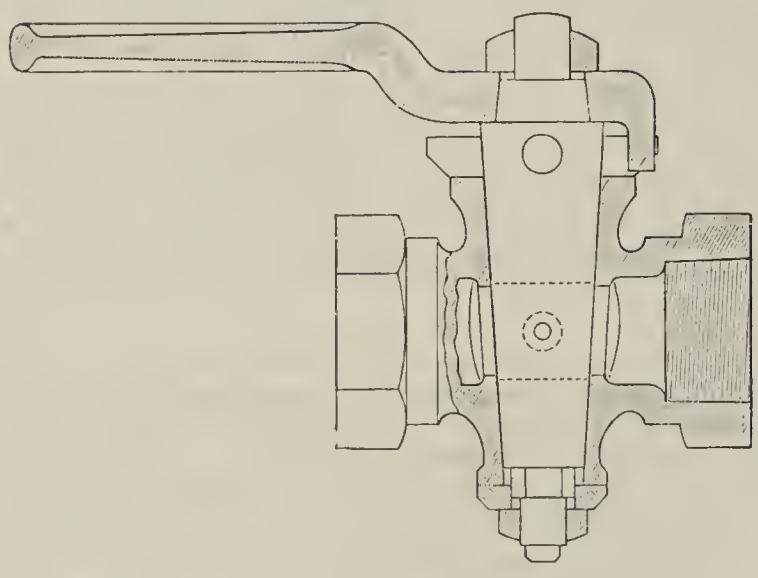


Fig. 2.—Sectional View.

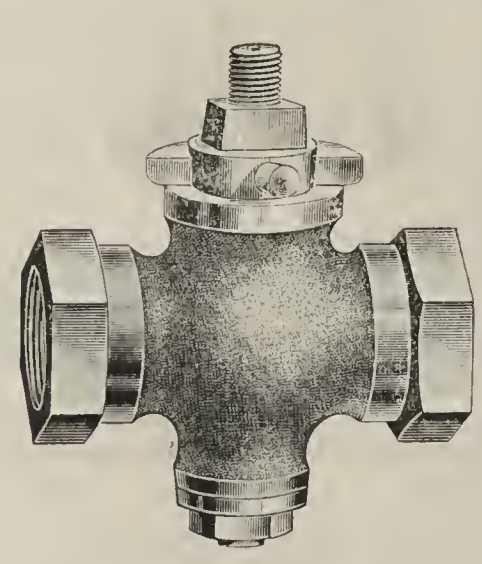

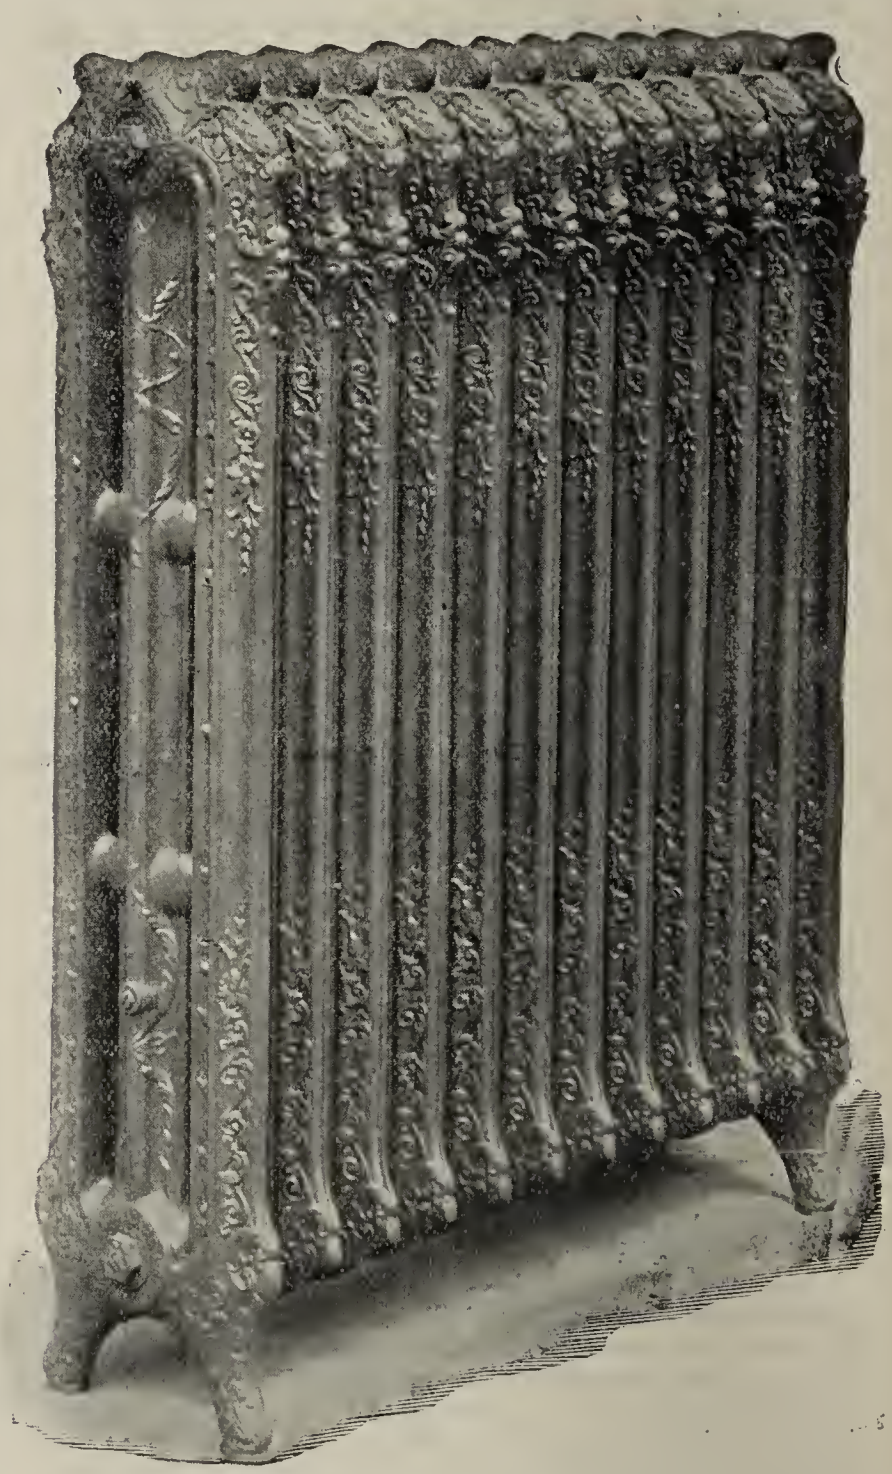

Fig. 3.—Showing Spud, which Denotes the Location of the Waste Hole in the Key.

The Touraine Radiator.

In the accompanying illustration we show the new radiator made by the International Radiator Mfg. Company of Cheektowaga, N. Y., and for which Fred. D. Johnson, 86 Centre street, New York City, is the general sales agent. The radiator is of the three column type, 2½ inches from center to center, containing 5½ feet per loop, and 38 inches high. A special feature of the radiator is its open form, allowing a free entrance for air at the bottom to pass over the inner heating surface of the radiator. The shape of the sections is such as to permit a large radiating surface on the outer portions of the radiator and to permit the inner portions to radiate directly through

The Touraine Radiator.

the openings between the sections. Another feature is that the columns are so arranged in reference to each other and so shaped as to effect a flue construction, so that the radiator is said to be highly efficient in circulating the air in the room by taking it off the floor and discharging it from the upper portion of the radiator thoroughly warmed into the room. Circulars giving full description, dimensions and prices can be secured on application.

Double Acting Pump Cylinders.

The Humphryes Mfg. Company, Mansfield, Ohio, have brought out two double acting pump cylinders, as here illustrated. Fig. 1 represents a double acting cylinder which can be used with all their pumps. On the up stroke the valve C raises, allowing cylinder to fill with water Spool valve G drops on valve seat on plunger bottom M and opens ports at upper end of plunger F, allowing water to pass through plunger and out through plunger tube H. On down stroke of plunger water passes through bottom of plunger M and around and through spool valve G, discharging through plunger tube H, filling top of cylinders,

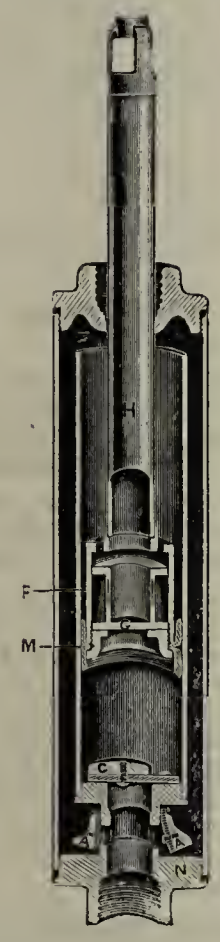

Fig. 1.—Double Acting Pump Cylinder.

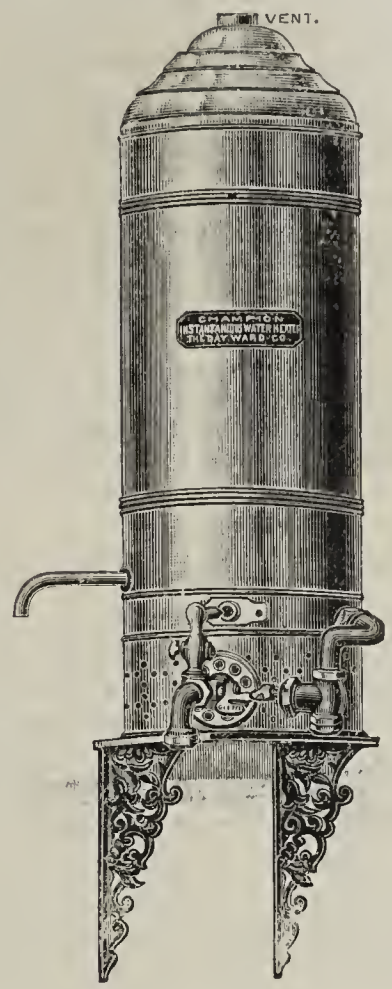

Fig. 2.—Double Acting Cylinder without Outside Shell.

giving full capacity. The flow of water being through plunger tube H, there are no valves required at upper end of cylinder. We are advised that one advantage of this construction, which will doubtless be appreciated by pump and well men, is the fact that it requires only the unscrewing of top cap to remove the plunger. There being no packing box or packing insures an easy working cylinder. The bottom cap N is made in one piece, forming bottom cap and valve seat. On downward stroke of plunger valves A A open, allowing water to fill upper end of cylinder. Valves A A are leather faced and weighted and are hinged so that when water rests on them they are perfectly seated. It is pointed out by the manufacturers that with but three simple valves at the bottom, durability is increased, and being easy of access they can be repaired at slight expense. The cylinder is said not to leak and never to require priming. Cylinders can be furnished with outside cylinders of iron or brass, but inside parts, we are told, should always be of brass. The cylinder Fig. 2 is similar in construction to the cylinder shown in Fig. 1, except that there is no outside shell, and it is used for submerged cylinder. The top cap has ports through top which allow the water to pass downward when the top of cylinder is filling. The valve below ports of cylinder at top is in one piece, faced and finished to seat perfectly. On down stroke of plunger F this valve drops and allows top of cylinder to fill. On up stroke the valve closes and water passes through plunger F and discharges through valve rod H. Plunger and top valve can be taken out by simply unscrewing top cap, as cap and valve are attached.

The Burgess Soldering Furnace Company, Columbus, Ohio, have during the past year added to their factory several new machines to enable them to make better goods more expeditiously. They expect to offer to the trade on March 1 a new Plumbers' Furnace on which a patent has been granted, a feature of which is two flames, one a blow pipe and the other a noiseless flame. These flames can be used separately or together, in the latter case giving a very intense heat.

The Champion Instantaneous Water Heater.

The convenience attending the use of instantaneous water heaters has changed them from a seasonable article to an article salable all the year around to a

The Champion Instantaneous Water Heater.—Fig. 1.—A General View.

plumber who introduces them to his trade and gives them the attention that a specialty that is profitable will warrant. One of the newest candidates for favor is the

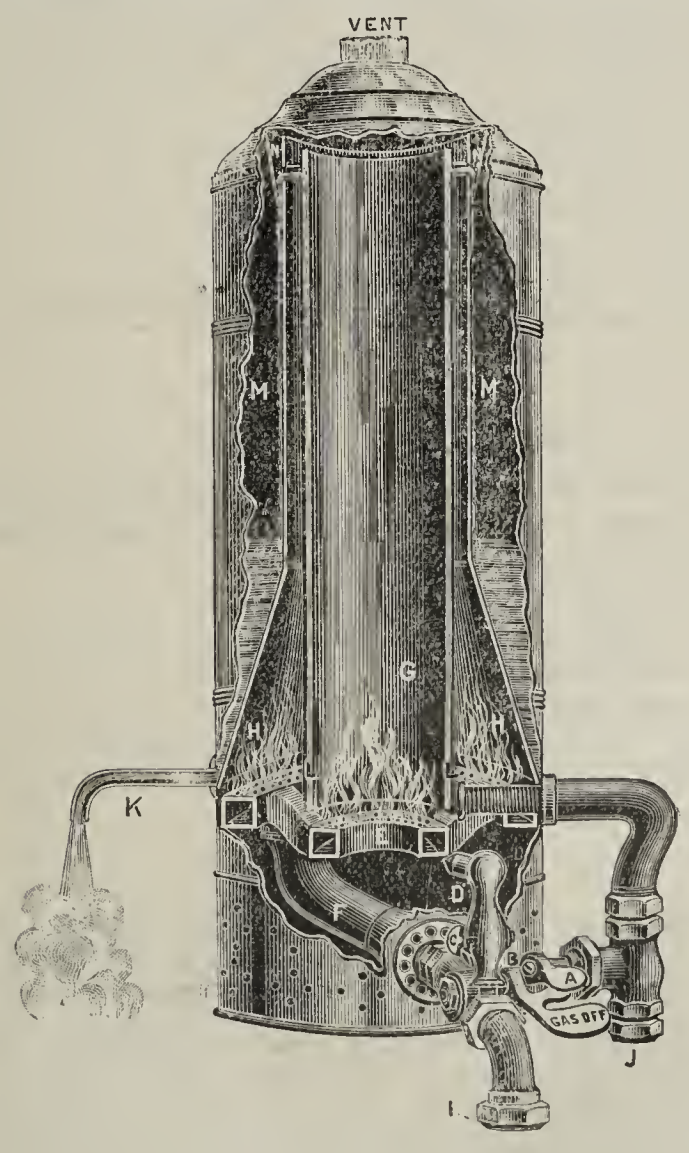

Fig. 2.—Interior View of Heater.

Champion instantaneous water heater made by the Day-Ward Company, Warren, Ohio. A general view is presented in Fig. 1 of the heater resting on a shelf as ar-

ranged for use in a bathroom or kitchen. The heater is made entirely of copper, tinned wherever water comes in contact with it, and fitted with brass trimmings. It is made in two sizes, the larger size having been just brought out, though the smaller size has been thoroughly tested and has demonstrated a capacity for heating 1 gallon of water a minute from 50 to 120 degrees, or will heat enough water for a bath in from 10 to 15 minutes with a consumption of 1 foot of gas per minute. An interior view showing the construction is given in Fig. 2. As will be seen from the cut, there are inner and outer burners, water chambers and combustion chambers. Water is supplied to the inner chamber direct, where it rises and overflows to the outer chamber through the tubes at the top. From the water chamber it is discharged hot, as shown. By the arrangement of the water and combustion chambers a large surface is presented for heating water and the full power of the gas is utilized. The cocks controlling the gas and water supply are so arranged that the gas cannot be left burning when the water is shut off, but as the water cock is closed the gas cock is also closed. The larger heater has a capacity for heating 1 gallon of water per minute from 50 to 140 degrees. The company also make a full line of copper lined, galvanized and enameled baths and have circulars giving prices and full particulars in reference to their goods.

Reception of Chicago Master Plumbers.

The courtesy is acknowledged of a complimentary ticket to the Chicago Master Plumber' Association's annual reception and ball. It will be held this year at Medinah Temple, Jackson boulevard and Fifth avenue, Tuesday evening, January 25. The Arrangement Committee consists of Paul Redieske, P. M. Murphy, C. C. Breyer, F. P. Schuster, C. J. Herbert, J. R. Alcock, E. Hackett, Robert Griffith, J. J. Doyle, D. J. Rock, T. P. Culloton, Samuel Smith, J. O. Sawkins and J. J. Clark. John G. Roland is chairman of the Reception Committee and Thomas Conlin is chief of the Floor Committee, with J. O. Sawkins assistant chief.

Pittsburgh Master Plumbers.

We learn from Secretary George Sands that at the annual meeting of the Master Plumbers' Association of Pittsburgh and vicinity, held in the Builders' Exchange, Pittsburgh, Pa., the following officers were elected to serve for the ensuing year:

President, John M. Addy.
Vice-President, Frank J. Gray.
Secretary, George Sands.
Treasurer, Frank McKnight.
Sergeant-at-Arms, W. J. Billings.
Executive Committee: D. G. Deeley, J. J. Kenedy, R. M. Tate and Joseph A. Weldon.

Peoria Master Plumbers.

The Master Plumbers' Association of Peoria, Ill., met in annual session on December 28, 1897, and elected these officers for the ensuing year:

President, W. W. Murphy.
Vice-President, Richard Erion
Secretary, John Boyd.
Treasurer, Daniel O'Connor.
Sergeant-at Arms, R. G. Trefzger.
Trustees: William Murphy, John M. Simpson and Rudolph Trefzger.

NOTES.

The American Boiler Company's Steam Boilers and Hot Water Heaters will hereafter be supplied to the Western trade by the Kellogg-Mackay-Cameron Company, 84 Lake street, Chicago. The company will also handle Steam Fitters' Supplies, Pipe, Radiators, &c., as has heretofore been done by the American Boiler Company at the same address. They will not do any contracting, but merely furnish the trade with supplies. The members of the company are Clarence V. Kellogg, James Mackay and Wm. A. Cameron, long connected with the American Boiler Company, and all men of wide experience in the heating line.

The Wallace Plumbing Improvement Company, Kokomo, Ind, manufacturers of Noiseless Water Closets, have issued a handsome 32 page catalogue of their products. They manufacture a variety of designs, all having low down tanks. These Closets are claimed to be not only noiseless, but so constructed as to flush the drain, have no rigid connections to break, contain no iron to rust, have no delicate mechanism to get out of repair, have no jet, and will not stop up. The designs shown comprise a wide variety of styles, from severely plain to highly ornamental.

I. Krueger, plumber and steam fitter, of Butte, Mont., passed through Chicago on Wednesday on his way to Europe. He was accompanied by his family, and is taking them abroad for a pleasure trip.

Patterson, Gottfried & Hunter, 156 Centre street, New York, send us a six-page folder of the McClelland Oil Purifier. It is designed for purifying the oil used in machine shops and factories, so as to allow the sediment to settle and to strain off the foreign substances. The oil enters the Purifier at top, and after passing through a warming chamber is discharged into a body of water for further purification, and has to pass through a wire gauze before it reaches the receptacle for the purified oil. For the use of steam fitters, or those who cut large pipe, these purifiers should be valuable for purifying the oil which has become foul with dust and chips from frequent use. The circular gives full particulars and can be secured on application.

Fred. Martin, Jr., has opened a plumbing shop in the Pythian Castle Building, at Wheeling, W. Va.

Charles E. Green has opened a plumbing, tinning and hardware store at Alfred, N. Y.

E. A. Seton has opened a plumbing and tinsmithing shop at Goffstown, N. H.

The W. Bingham Company, Cleveland, Ohio, send out a catalogue of Machinists' Tools, Carpenters' Tools, Blacksmiths' Tools and Manufacturers' Supplies. The catalogue is divided into four sections, A, B, C, D, covering the classification aboved noted. In the Manufacturers' Supplies is a subdivision of Plumbers' and Steam Fitters' Supplies, as well as other goods of interest to our readers

Notice is issued to the trade under date of December 30, 1897, that the partnership lately existing between Theodore Hepe, William Koven and Ludolph Oscar Koven, under the name of Hepe, Koven & Co., 18 Spruce street, New York City, has been dissolved, and the business will be continued by Ludolph Oscar Koven and Gustav H. Koven, under the name of L. O. Koven & Brother. The company announce that they will keep up the standard of the goods heretofore made by the old firm, and specially note that they will use only *iron* of the best quality in their Galvanized Range Boilers.

We have received from the Columbian Construction & Machine Company, Minneapolis, Minn., a photograph and circular of their new Columbia Hot Water Boiler. The Boiler is of the horizontal sectional type, and a surface burner, with the sections so arranged as to present a large amount of fire surface. The fire pot is corrugated to increase the heating surface, and the ease with which it can be set up is said to be one of the features. The Boiler is also adapted for steam heating. Full particulars and prices can be secured on application to the house.

The Nason Mfg. Company, 71 Beekman street, New York City, are just issuing a new price-list of their Valves, Fittings and Gauges for anhydrous and aqua ammonia; also Fittings, Valves and Cocks for brine circulation, adapted for ammonia machinery for ice making and refrigerating purposes. The special feature of the catalogue is a change in prices, which took effect January 1. The catalogue shows engravings of Valves, Elbows, Flange Unions, Return Bends and Couplings, besides Gauges and Glass of various shapes adapted to this work. One of the specialties shown is the new Nason Joint for making connections on ammonia service pipes.

Joseph Cleve, special partner, has retired from the Kohler Furnace & Steam Heating Company, Boston, Mass. The business will be continued by Joseph Kohler and Joseph E. Hertig under the old firm name.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until January 27, for a hot water heating and ventilating apparatus for the new extension of the United States Court House and Post Office Building at Little Rock, Ark.

Judge Jacob A. Kohler, in the Court of Common Pleas, at Akron, Ohio, on December 30 rendered a decision that the Ohio plumbing law was unconstitutional. The chief point made against the law was that it discriminated against the individual in favor of firms or corporations. In his decision he said: "A man may be a practical plumber, he may have had many years of experience and may be an expert, yet he is at once required to apply for a certificate, submit to an examination, and pay a license fee, before he can work at his trade. But for a firm of

partners composed of two, three or more persons, all that is necessary is that one member shall obtain the certificate and then all the other partners can work at the business, whether they are qualified or not, and they may employ, in addition, as many workmen as they please, whether they are qualified by experience or not."

Mills, Horton & Reed are a new firm at 136 Eddy street, Providence, R. I., who make a specialty of Mill Supplies, Valves, Pipe and Fittings. In addition to the fine assortment of stock which they carry they have a well equipped pipe cutting shop.

Thomas J. Cusack has moved his plumbing shop to the Van Nostrand Building, 259 Fair street, Kingston, N. Y.

At the annual meeting of the Plumbing Board of Kingston, N. Y., Bernard Loughran was elected president, P. A. Canfield treasurer, and Augustus Schepmoes secretary.

At midnight on New Year's eve the licenses of 135 plumbers at Buffalo, N. Y., expired, and made it necessary for them to take out new licenses from License Clerk Wilcox, at the Mayor's office, at the rate of $10 each. In addition to their licenses the plumbers must furnish new bonds for $2000, and each must have at least two sureties.

Prowse & Pelton are a new firm in the plumbing business at Herkimer, N. Y., succeeding Prowse & Thompson, Frank E. Pelton having purchased the interest of E. S. W. Thompson.

F. G. Wilson has made some handsome improvements in his plumbing shop on Ash street, Waterville, Maine.

It is reported that at least 40 per cent. of the plumbers examined at Milwaukee, Wis., failed to pass the examination. At a special meeting of the Master Plumbers' Association of Milwaukee, Wis., a resolution was adopted indorsing the action of the State Plumbers' Examining Commission and expressing approval of the new State law as well as expressing confidence in the Plumbers' Examining Board.

John McKarnes, formerly a resident of New Castle, Pa., has established a plumbing business at Ripple, Col.

O'Day & Moore are a new plumbing firm at Owensboro, Ky., located on East Main street.

George H. Hersey of Buckfield, Maine, has completed the installation of a steam heating system in McKenzie's new brick block, which will contain three offices, seven tenements and a large store. The Boilers used are of Mr. Hersey's invention, and manufactured by him at his plant in Buckfield.

The New Jersey sanitary potters received, after all, the restoration of the 12½ per cent. cut made in their wages in 1894, as promised by the employers last summer, and the expected strike was averted. A conference between the employers and the men was held last week at Trenton, N. J., at which it was decided to make the restoration, to remain in effect until February 1. In the meantime it is hoped that the Eastern and Western manufacturers will come to some agreement upon a uniform scale of wages in the industry.

T. C. Lamson, Elizabethtown, Essex County, N. Y., has sold his hardware store to D. F. Stetson & Co., who will enlarge the store and keep all kinds of Light and Heavy Hardware. They have secured the services of T. Frank Clark, who will manage the plumbing department. Stetson & Co. will be glad to receive price-lists of goods in their line from manufacturers and jobbers.

Frank Schimpf, Albany, N. Y., recently presented Plumbing Inspector George Bachman with an appropriate souvenir of his trade. It was a miniature cast iron bathtub of enameled finish.

J. L. McBride, Missoula, Mon., has moved his plumbing shop to the Yerrick Block. He has been busy making a lot of Tinners' and Hardware Sundries, and is selling the Garland Economic and Surprise Stoves.

The Master Plumbers' Association of Cincinnati, Ohio, decided that with the first of the year they would inaugurate a war upon the unlicensed plumbers plying the vocation in the city. The discussion was productive of a great deal of excitement at the last meeting of the association, and after a long session it was decided to swear out warrants for all plumbers in the city who have no license. This, it is said, may involve certain members of the Fire Department who were plumbers before they became firemen. It is the custom of these men to repair the breaks in the plumbing about the various fire houses, but, while the majority of them are competent plumbers, none of them have taken out licenses.

Henry Goss, Dent Yates, Ed. Springsteen, Fred. Hacker and W. E. Searight, representing the master and the journeymen plumbers of Kansas City, Mo., held a conference on December 30, 1897, with Mayor Jones and Water Works Superintendent Longwell about matters of interest to the associations they represented. They asked the Water Works Department to cease granting permits to do plumbing work to parties who are non-members of the unions and who have not paid the regular tax of $10, and also that the department grant no more permits to engineers of buildings to do plumbing repair work. They also urged the city to stop selling water meters to consumers and that the plumbers be allowed to bid at such sales and that the consumer shall buy of the lowest bidder. They further asked that the Water Department inspectors be required to pass regular plumbers' examinations. City Plumbing Inspector Sieben was at the conference, and after the entire subject was gone over it was agreed that the complaints should go to the Council and the Board of Public Works for investigation.

The Alfred Edmondson Company have been organized at New Haven to conduct a plumbing business with a capital of $1000 in ten shares of $100 each, all paid in. The subscribers are Alfred Edmondson, one share; Florence A. Edmondson, eight shares, and William H. Edmondson, one share.

The Eastern manufacturers of Lead Pipe and Sheet Lead reduced the price of those materials on January 1. Particulars of the changes made will be found in our trade columns.

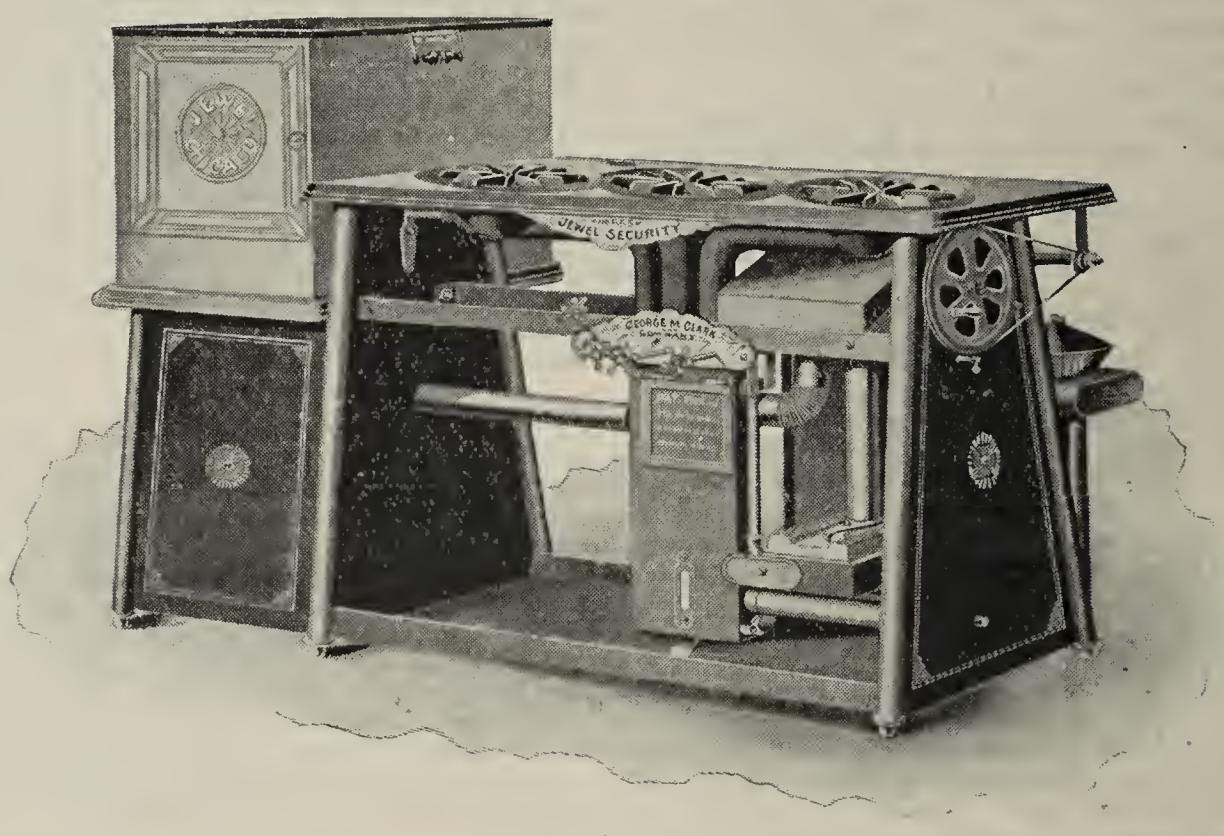
Stanley G. Flagg & Co., Philadelphia, announce that they have opened a New York office in the St. Paul Building, 220 Broadway, under the management of C. A. Jaynes.

We received in our mail what seemed to be an old-fashioned calfskin wallet with a strap passing around it to prevent its contents being lost. On opening it we found a draft payable to bearer for 365¼ happy days on the Bank of Health, Wealth and Happiness, drawn by the Judson A. Goodrich Company, 120 Beekman street, New York City. At the end of the draft is a suggestion that the receiver send a trial order for the Water Seal Automatic Air Valves, which, it is claimed, will make all interested glad. On opening the wallet full we see the trade-mark of the Judson A. Goodrich Company, which calls attention to their line of Valves and other high grade steam specialties, with the suggestion that they will be good goods to use during the coming 12 months.

The will of Alfred Nobel, the Swedish chemist and inventor of high explosives, who died a year ago, has been proved. About half the estate is to be invested and the interest divided annually into five prizes of about $10,000 each. Prizes 1, 2 and 3 are to be awarded to the persons making the most important discoveries in physics, chemistry, physiology or medicine, Prize 4 is to be given to the person making the best literary contribution on the subject of physiology or medicine, and Prize 5 is to be awarded to the person who has achieved the most or done the best things looking to the promotion of the cause of peace throughout the world. These prizes, which are all open to any persons anywhere in the world, will be awarded by the various Swedish academies.

A new type of the Gordon rapid fire gun of 5-inch caliber has just been completed at the Watervliet Arsenal and will be shipped to Sandy Hook for trial. It is claimed that the improved breech mechanism of the new gun makes it the most effective type of secondary ordnance ever produced in this country.

A dispatch from Port Townsend, Wash., states that during the coming season the Standard Oil Company will begin extensive operations on the Pacific Coast. Their oil territory in Alaska will be developed and the output brought to the cities of the Pacific slope for distribution west of the Rocky Mountains. It is also contemplated to ship oil from the Coast to South America and Australia.



During the year 1897 the value of exports from Newport News, Va., exceeded that of 1896 by more than $8,000,000, showing that that port is rapidly coming forward as one of the leading seaport cities of the South. The actual figures of exports in 1897 were $26,304,126, as against $18,150,049 in 1896 and $13,584,377 in 1895, so that in two years the exports of Newport News have almost doubled.

The control of the Trinidad Asphalt Company, whose headquarters have heretofore been in New York City, has been secured by a syndicate of English capitalists, and from January 1 the headquarters of the concern will be located in London. The company have been reorganized and their capital increased from $3,500,000 to $5,000,000. Their supply of asphalt comes from the West Indian island of Trinidad.

THE RETAIL STORE.

THE ENAMELED WARE CONSOLIDATION.

The negotiations between manufacturers of enameled and stamped ware have been in active progress during the week, and it is understood that the prospects of an early completion of the proposed combination are daily becoming more clear. Ex-Congressman Niedringhaus of the St. Louis Stamping Company, who has again come East, has been in communication with representatives of the various concerns interested in the project, and meetings have been held this week in New York City with the result that the final consummation of the plan, so far as regards a majority of the enameled ware makers, is regarded as almost certain. There are numberless details, however, to be adjusted, which it may take some weeks to get into shape, so that the final organization of the new concern is not likely to take place immediately. That the new combination will not include one or two of the largest interests in the industry is generally accepted as a fact. The oldest and most important enameled ware manufacturing concern in the East have definitely refused to enter it.

The Jewel Security Gasoline Stove.

The Jewel Security Gasoline Stove.

An illustration is herewith presented of a radical departure from the beaten track in gasoline stoves. George M. Clark & Co., 72 to 76 Lake street, Chicago, have brought out an entirely new line of gasoline stoves, named the Jewel Security, of which they are the sole manufacturers. The style shown in the illustration is their largest size, with three burners on the top and a burner on the step. A smaller size is made, with two burners on the top and a burner on the step. It will be observed that the gasoline tank instead of being elevated is placed below the level of the top of the stove, in the rear. The Jewel Security stoves do not burn gasoline in the burners, but gas generated from the gasoline. They are therefore, in fact, gas stoves. The following description is furnished by the manufacturers:

"The gasoline tank is 3 inches below the valve outlets. Not a drop of gasoline can escape from the stove even if any or all the burner flames should be blown out and the valves left open. For this we depend upon the simple fact that a liquid will not rise above its level. The unobstructed operation of the unfailing law of gravitation makes these stoves absolutely safe. We do not rely upon a float or any other mechanical device, which may fail at any moment. The tank cannot be filled except by raising the tank cover, which automatically and instantaneously puts out all flames. The tank is also in a fixed position and at a convenient hight to fill.

"The gas for the starting burner is generated by a rotary device in a brass cylinder connected with the gasoline tank. Turn the wheel at the right hand end of the stove for 30 seconds, first applying a lighted match at the door in the generator casing; then open the valves and light as many burners as are needed. No dripping of gasoline, no smoke, no smell; nothing but a pure gas flame for lighting; no puffing or blowing, and the full capacity of the stove is available at once. The freedom from odor is absolute, both in lighting and while burning and when the burners are turned out; there is no unconsumed gas in the stove.

"When the kitchen is so cold that the starting burner does not light, turn the wheel with a reverse motion for a few seconds, first applying a lighted match to the warming burner. After thus heating the air pipes and connections, proceed in the regular way. It is seldom necessary to use this burner, but its addition makes the Jewel Security an all-the-year-around and all-the-world-around stove, working as perfectly in December as July, and in the Klondike as on the Equator.

"The gas is generated from gasoline and burned in the same state in which it is used in our Jewel Smokeless Generator stoves; that is, the gas is heated and expanded before burning instead of being burned unexpanded and nearly cold, as in the Princess stoves. This means that more heat units result from every gallon of gasoline, and the economy which we claim for the Jewel Smokeless Generator stoves over all other low tank stoves and over Process stoves holds good for Jewel Security stoves also.

"The burner caps are 5 inches in diameter and make a large hot flame. There are two burners on the step 8½ inches from center to center, so that a cooking vessel can be used over each burner. A small flame at the generator is burning constantly while the stove is in use. This heat is further utilized by conducting it to the stove top, where it warms the stove top and keeps food or water at the simmering point. This fills a want long felt on gasoline stoves. A warm stove top is a great convenience, as cooked articles can be kept warm indefinitely.

"The valves which control the flames are not needle valves, but valves with a blunt end which have slight wear and are practically indestructible. The gasoline is always at least 3 inches below the valve outlets. For this reason the outlets are not clogged with sediment washed into them by the gasoline, and are not rusted or gummed up by impurities in it.

"The gas is delivered into the burner tubes from an injector plate which has several openings so arranged that

the burners are as hot as those of a high tank stove, althongh the tank is 3 inches below the valve outlets and the pressure is low.

"The tank, with its accompanying parts, is of heavy sheet brass, polished and lacquered. The generator tubes are of brazed brass tubing. The generator, injector head and injector plates are of cast brass. The burner caps, burner tubes, and generating, starting and warming burners are of cast iron. The generator casing is of heavy sheet steel. The brace bars are of heavy steel. Tops and legs are handsomely japanned and ornamented. The name and number plates are highly polished and nickel plated.

"The tops are of smooth cast iron with flush grates, and yet there is no trapping of gas. The legs are of heavy sheet steel, formed into a roll at the edges so as to give great strength and also appear massive.

"The stoves as shipped are tested and ready for use when removed from the crates. No time is wasted by the dealer in unpacking parts and setting up the stove."

The Dean Can Opener.

Henry E. Dean & Co., 180 Austin street, Worcester, Mass., manufacture the Dean can opener, a general view of which is shown in the accompanying illustration. The construction of the utensil is clearly revealed in the engraving, it consisting of an upper forked casting with a blade beneath. The opener cuts on either side. All parts are nickel plated so as to keep it from rusting.

The Dean Can Opener.

MEMORANDA.

The Lalance & Grosjean Mfg. Company, New York, made by far the largest output of Enameled Ware in their history during the year just closed Their factory at Woodhaven, L. I., ran almost continuously throughout the year and absorbed all the products of the company's rolling mill and Tin Plate plant at Harrisburg, Pa. Both establishments are running to their full capacity, and the concern start the new year with a large volume of orders on their books. The gradual substitution of Enameled Ware for Tinware throughout the country is very clearly reflected in the business of the concern, the orders for Tinware showing a steady decrease, so that at the present time this branch of their business, which was at one time a very large one, is relatively quite unimportant. The L. & G. Enameled Ware is finding its way to all quarters of the globe. The firm filled an unusually large number of export orders for these goods in 1897 and look for a still greater increase in this department during the present year. The company are getting out a new catalogue of Enameled Ware, which will be ready for distribution to the trade in a week or two.

The Wagner Mfg. Company, Sidney, Ohio, report a very satisfactory year for 1897 and have recently made changes to enable them to meet the increasing demands for their Cast Iron and Aluminum Hollow Ware.

The catalogue of Tinware issued by Kerwan & Tyler, 714 Water street, Baltimore, Md., is a neatly printed volume of over 100 pages. The goods are divided into sections classed as Stamped Ware, Deep and Shallow; Spoons, Japan Ware, Pieced Ware, Heavy Polished Ware, Copper and Brass Goods, Sheet and Wrought Iron Ware, Galvanized Ware, Hollow Ware, Wire and miscellaneous goods, Tinners' Trimmings, Enameled Ware and assortments, the whole being indexed alphabetically at the end.

The Grand Rapids Refrigerator Company, Grand Rapids, Mich., have issued in green covers an edition of their catalogue relating to the Leonard Cleanable Refrigerators. It is a volume of 90 pages and is profusely illustrated with cuts showing the outside and inside of a very great number of different styles of the Leonard Refrigerator, varying from the simplest Ice Box to the most elaborate sideboard Refrigerator. In the early pages detail views are given of all the special features of this Refrigerator and the merits of its construction are carefully explained. The bulk of the catalogue merely presents illustrations with tables of sizes and prices of the different styles. In calling attention to the changes of style for 1898, it is pointed out that the former heavy sunk carving is changed to a dainty design in raised carving, and the bottom and back of the case are now paneled as well as the front. These catalogues will be sent free upon application.

The Indiana Wire Fence Company, Crawfordsville, Ind., send to their friends a calendar for 1898 decorated with a very charming engraving after a painting by Kray. The calendar calls attention to the products of this concern, which include Wire, Wire Nails, Staples, Fencing, Wire Stretchers, &c.

A charter was recently issued to the Griswold Mfg. Company of Erie, Pa., whose capital is placed at $100,000.

The Toledo Tinware Mfg. Company, Toledo, Ohio, makers of Pieced, Stamped and Galvanized Ware, keep themselves and their goods before their customers by means of a poster calendar, which they distribute with their compliments. The sheet is brass bound and the illustration is an attractive young baker handling sheet metal goods of the Toledo Tinware Mfg. Company's production.

Pfender Brothers, Evansville, Ind., issue a handsome calendar for the new year. The card, cut in silhouette, presents two pretty children, and they direct attention to an announcement respecting the value of Pfender's Patent Metal Pump. The coloring is very beautifully done and the whole will make an attractive wall ornament.

The fitting up of the new factory of the Hill-Whitney Aluminum Company, at Waltham, Mass., was completed this week and the company are now in shape for operation. They are occupying a portion of the Waltham Emery Wheel Company's building, to which their employees and manufacturing plant were removed last month from their former location at Fairhaven, Vt.

The Indiana Mfg. Company, Peru, Ind., are distributing their catalogue of North Star Refrigerators for the season of 1898. The catalogue comprises 48 pages, displaying a large line of Domestic Refrigerators. They are made of hardwood and lined with cork. The cabinets are furnished with carved or plain panels. A cheaper line is made under the name of Indiana Refrigerators. The company not only furnish large Refrigerators for heavy service, but are also prepared to build cooling rooms to order.

Wright & McKenney, Centerville, Md., are building an addition to their store, which will make the total length of the establishment 328 feet, with a frontage of 25 feet. The house are wholesale and retail dealers in Shelf and Heavy Hardware, Agricultural Implements, Stoves, Tinware, Sporting Goods, &c.

H. A. Decker, dealer in Stoves, Tinware and Hardware, has removed his stock from Crested Butte, Col., to Ward, where he is now comfortably settled. Mr. Decker refers to business as fair, but is looking for a much better demand in the spring.

Dickes & McCready, Butler, Ohio, are enlarging their warehouse and are also adding a tin shop to their business.

Wm. Sigler & Co. of Chicago have purchased the Hardware and Implement business of J. W. Evans & Co., Webster City, Iowa. They state that their store is one of the best furnished in the State. It is 130 feet deep, with an L 28 x 26 feet. The wareroom is 116 x 90 feet, with railroad switch at side. The firm carry a full line of Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

H. McGee Sanders has opened a new Hardware store at 577 King street, Charleston, S. C. Mr. Sanders is carrying Shelf and Heavy Hardware, Stoves, Tinware, Implements, Sporting Goods, Saddlery, &c.

The Columbia Gas Illuminating Company, 818 Arch street, Philadelphia. are calling the attention of the hardware and jobbing trade to their line of incandescent gas lamps and mantels. They point out the fact that there is a large field for the hardwareman who will handle this line of goods, as previous productions in the line have been notably high priced. The company state that their lamps can be used wherever gas and gasoline are procurable, and their use insures a brilliant light with a great saving in gas consumption.

The Board of Ordnance and Fortification of the Army has made an allotment of $31,000 to be expended by the Army Ordnance Bureau for tests of high explosives. It is contemplated to devote this money to the purchase of armor plates. Tests will be made with these plates under conditions closely resembling an engagement between forts and heavy ships, in order to determine what penetration and explosive effect would create the greatest amount of damage to an invading fleet. The experiments are to be conducted at the Sandy Hook proving grounds next summer.

The Indestructible Post.

The cuts shown herewith represent the Indestructible post, manufactured by the Indestructible Post Company,

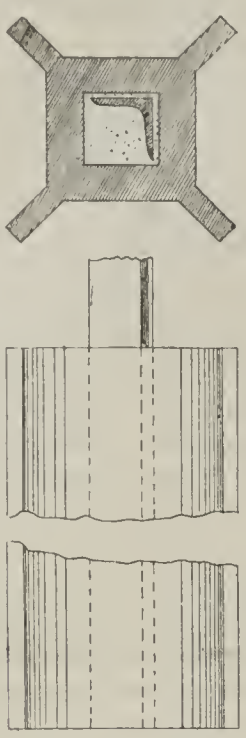


Fig. 1.—The Indestructible Post.

Brazil, Ind. In Fig. 1 the base of the post is shown, the darker portion of the cut being a sectional view of the base. The post consists of a base made of burnt clay and a post of steel, to which the fence wires are fastened by metal staples. The space between the base and the post is filled with cement, so that the steel post will not come in contact with earth or water, and consequently, it is pointed out, will not rust. The exposed part of the post is painted with a preparation which, it is stated, makes it extremely durable. For common line posts a base 2½ feet high is used. A 1½-inch square hole in the center of the base extends through its whole length, and the clay surrounding it is ¾ inch thick. The corner projections are ½ inch thick and extend along the entire length of the base. The manufacturers state that this shape of base affords a greater resistance to the earth than round or square posts of equal diameter; also that the post is not affected by heat or cold, withstanding all the ravages of time. The indestructible posts are not only adapted to plain or barbed wire fences, it is explained, but to any style of patent fencing, such as woven wire, cable, mesh, poultry netting, &c. Hitching, lawn, signal, mile and other posts are also manufactured by the company.

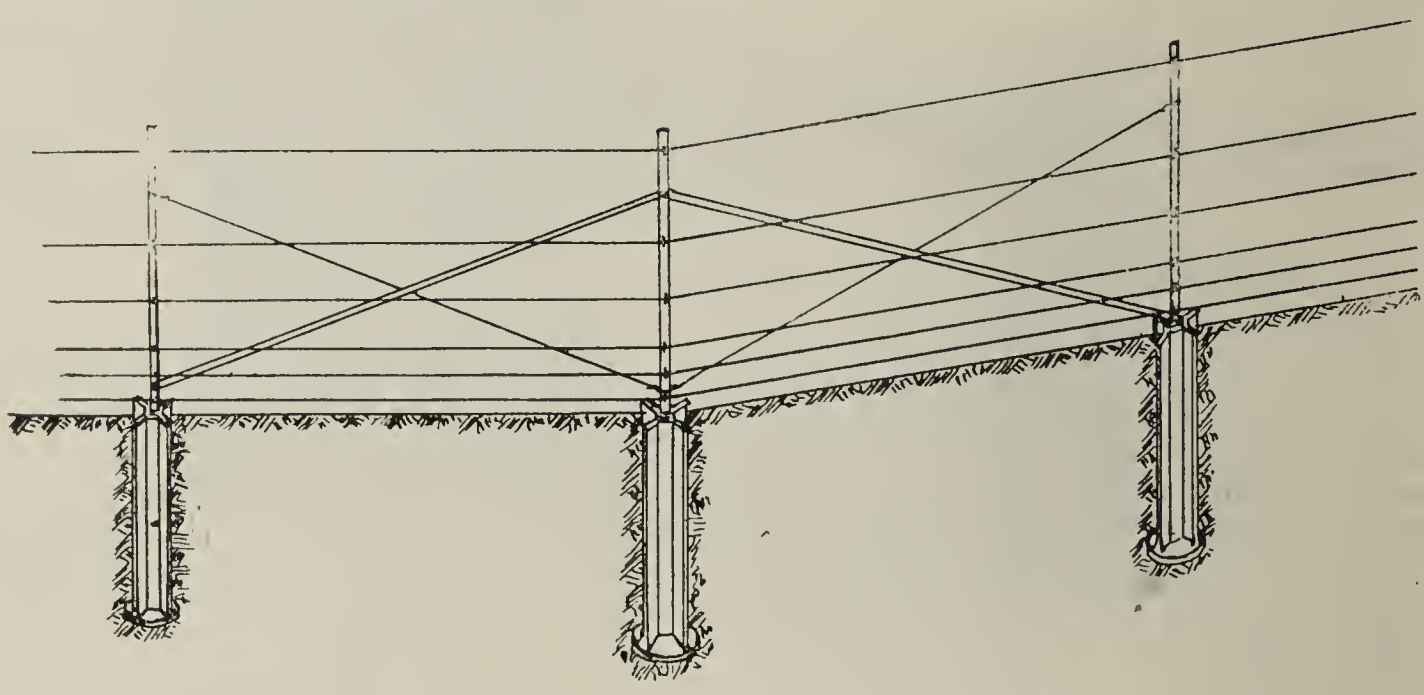

Fig 2.—Indestructible Post Fence.

A Unique Letter Head.

Considerable ingenuity has been displayed in the arrangement of articles making up the letter head of the Clark Supply House, Noblesville, Ind., of which a reproduction is herewith given. The lines of goods carried include Tile, Mantels, Stoves, Chandeliers, Horseshoes, Blacksmiths' Supplies ; Gas, Steam and Well Supplies and Tools ; Fire Clay, Fire Brick and Sewer Pipe; Wood and Iron Pumps. In selecting the articles of which the letters are made a fair representation of these lines has resulted. Moreover, it produces a letter head which once seen is readily recognized and immediately associated with the concern using it.

The Maine Mfg. Company, Nashua, N. H., have sent a special agent to the South and West in the interests of White Mountain Refrigerators of their manufacture and report that he is remarkably successful in placing orders for these goods. In addition to the White Mountain Refrigerators they have also sold a large number of their new Cleanable Duplex Circulation Klondike line, of which they are sole manufacturers. The firm are about to publish a handsome Refrigerator catalogue, which they will be glad to send to reliable dealers upon application.

Letter Head (Slightly Reduced in Size).

TIN PLATES.

William H. Trotter.

William Henry Trotter, for many years head of the well-known firm of Nathan Trotter & Co., importers and dealers in tin plate and metals, Philadelphia, Pa., died of pneumonia at his residence, 1303 Spruce street, Philadelphia, on January 5, after a few days' illness. Mr. Trotter was born in Philadelphia on November 1, 1822, and entered, when young, the firm established by his father, Nathan Trotter, in 1790. He retired a few years ago, and the business of the firm has since been conducted by his three sons. He was well known in the business and financial circles of Philadelphia, and at the time of his death was connected as a director with a number of local financial and insurance corporations. He was also a member of the Art Club and of the Pennsylvania Historial Society. Besides his three sons, Mr. Trotter is survived by his wife and three daughters.

American Base Box.

The American Tin Plate Company, Marquette Building, Chicago, state that they have not prepared the American base box system of tin plate quotations merely for their own special use, but for the trade in general. They copyrighted the Ratio and Code Book simply because that seemed to be the proper course, and not to keep others from using it. They request us to impress upon the trade that any one desiring to use the matter of the Ratio and Code Book will be given permission upon application. To facilitate the wider circulation of the information, compiled by them at great expense, they will furnish a full set of electrotypes of the pages of their book for $100, covering all the rules, ratio and code. The electrotype of the title-page has a space cut out for the insertion of the name of the manufacturers or jobbers who desire to use the matter for this purpose. As it would cost much more than $100 to set the type anew for the work, this will effect a very considerable saving. The offer is so liberal that the company are warranted in expecting it to be embraced by numerous members of the trade.

SCRAP.

At the meeting of Tin Plate makers held last week at Columbus, Ohio, a committee was appointed to prepare plans looking to a definite organization of the Tin Plate Makers' Association of the United States. The committee has been in session this week at Pittsburgh, but up to the time of going to press no news of the result of their deliberations had been received. It is understood that an earnest effort will be made to get the manufacturers together with the view of arranging a basis of prices by mutual argeement. While prices may not be advanced to any extent, it is felt that the unnecessary cutting that is now being done in some quarters should be checked in some way and the market steadied. The Columbus meeting was attended by a large number of makers, but it is understood that some of the most important interests were unrepresented. An effort will be made to get these concerns into line.

The Humbert Tin Plate Company, at Connellsville, Pa., are considering the advisability of enlarging from a four-mill plant to a six-mill plant. If certain arrangements can be made with parties who bought lots when the initial plant was established at Connellsville the additional two mills will be erected.

The business of Lambert, Stoughton & Cooper, dealers in Palm Oil, &c., Philadelphia, will be continued in future by Edward C. Stoughton and Francis L. Cooper, under the firm name of Stoughton & Cooper.

Marshall Brothers & Co., Philadelphia, have ordered a No. 2 Mesta Pickling Machine from the Leechburg Foundry & Machine Company, Pittsburgh, Pa.

A greeting for the new year comes from Follansbee Brothers Company, Pittsburgh, Pa., on a calendar blotter. The decoration shows Fortune, or some other benignant deity, pouring out prosperity upon the United States.

The latest official report of the Swansea Royal Metal Exchange, Swansea, Wales, has the following : From reports as to the American Tin Plate trade received, we are not booking any orders from that country other than the oil Plates, and we are told that in a very short time native production will have been increased so much that they will have a considerable surplus over their own consumption, which will, it is feared, be disposed of in other markets where they can compete with Welsh makers upon equal footing, so that we are not only likely to lose their trade entirely, but will also find them keen competitors elsewhere. Such is the present serious outlook, and it is predicted that very soon the wage rate in America will be brought down lower than that paid in this country, and that with the cheaper raw material will enable the Americans to compete with us in the matter of production irrespective of any impost of protective duties.

Official returns give the salmon pack of British Columbia for 1897 as 1,007,838 cases. This is larger than the pack of any previous year. Sixty-four canneries were operated in British Columbia last year.

The Morton Tin Plate Company, Cambridge, Ohio, who make a specialty of the manufacture of high grade Charcoal and Terne Plates, advise us that their business during 1897 was very satisfactory, they having all the business they could undertake. The company's works were in operation continuously throughout the year, and the demand for their special high grade Plates, made by the old style palm oil process, was considerably in excess of that of 1896.

E. L. Parker & Co., dealers in Tin Plates and Metals, 201 and 203 South Charles Street, Baltimore, Md., have favored us with one of the dainty calendars for 1898 which they are sending out to their friends and customers as a New Year's greeting. It is in the form of a series of cards printed in gold and embellished with clusters of forget-me nots in natural colors. Accompanying the calendar is a card giving the firm's various special brands of Tin and Terne Plates.

The plant of the Neshannock Tin Plate Company of New Castle, Pa., will be started up this month or early in February. This plant is the enlarged and remodeled mills of the old Arethusa Iron Works. formerly operated by Geo. W. Johnson.

The capital stock of the Shenango Valley Steel Company of New Castle, Pa., has been increased to $2,500,000. The additional capital stock will be used in the erection of the new Tin Plate plant of the Shenango Tin Plate Company, which will be operated and owned by the Shenango Valley Steel Company.

Edward H. Trotter has retired from the firm of Nathan Trotter & Co., Philadelphia. The business in Tin Plate and Metals will be continued by the remaining partners under the same firm name.

Hollinshead W. Taylor has been admitted as a member of the Tin Plate and Metal firm of N. & G. Taylor Company, Philadelphia, from January 1.

The rope wheels to be used in the power transmission plant of the new works of the Shenango Tin Plate Company, at New Castle, Pa., will be 22 feet 6 inches in diameter and 14 feet face, and will weigh 130 tons. They will be cast in sections and finished for 2-inch driving rope. There will be 11 of these wheels, and they will be built by the Edward P. Allis Company of Milwaukee, Wis.

W. J. Rainey, the Connellsville coke operator, with offices in Cleveland, Ohio, recently bought about 40 acres of very valuable coal lands in the heart of the Connellsville region. It is said the price paid was more than $1500 per acre, probably the highest price ever paid for coal lands in the coke region.

STOVE TRADE NOTES.

TRAVELING SALESMEN FOR 1898.

The Gem City Stove Company of Dayton, Ohio, have made arrangements with the following salesmen, who will represent them in the territory indicated: John P. Bauer will cover Michigan and Ohio; J. B. Kenney, Indiana; while C. H. Greene, Jr., with assistants, will cover Missouri, Iowa and Illinois.

The Charter Oak Stove & Range Company of St. Louis, Mo., will be represented on the road the coming year by S. H. Shannon, George P. Phillips, Charles Orrick, Frederick P. Haus, Robert E. Ryan, H. D. Knight, Charles N. Kelly, E. J. Moore, D. Hott, J. W. Jacob and Carl Phillips.

The Lebanon Stove Works of Lebanon, Pa., will have their interests looked after by J. H. Kurtz, who will cover Western Pennsylvania, Lancaster County and parts of Virginia and Maryland; and Stephen Light, who will cover Eastern Pennsylvania, New Jersey, Delaware and Eastern Maryland.

The Danville Stove & Mfg. Company of Danville, Pa., have arranged with the following salesmen to travel in the interests of their goods in the territory indicated: A. L. Canfield will be sales agent in New York and New England; J. C. H. Lynn, sales agent in Delaware, Maryland, Virginia, New Jersey and Eastern Pennsylvania; R. E. Edmunds will cover Western Pennsylvania and Ohio: while J. A. Pinkerton, A. H. Magoon and Peter Olsen will represent the company in Chicago, Ill.

The Fischer-Leaf Company, Louisville, Ky., will be represented this year by the following traveling salesmen: In Texas, by R. E. Finch; in Indiana, Louisville, Georgia, Alabama and Mississippi, by J. W. Hickman; in Ohio, Kentucky and Tennessee, by William Schlarger; and in Louisville, Ky., by Philip Ronnuell.

The Eclipse Stove Company, Mansfield, Ohio, report that 1897 was one of the best years in their history, and they intend to make 1898 "eclipse" all others by increasing their line of stoves and ranges by a number of new patterns and many improvements, and by the addition of several traveling salesmen. H. D. Bell, who has been representing the firm for the past five years in Illinois and Iowa, has been placed in charge of the sales department at the main office at Mansfield, Ohio. The following is a list of their repositories and traveling representatives: At Kansas City, Mo., Rood & McIntyre, manager, who will look after the business in Western Missouri, Kansas and Indian Territory; at Omaha, Neb., by Oscar Millsap, manager, who will look after Nebraska, Western Iowa, Colorado, the Black Hills, South Dakota and Eastern Wyoming; at St. Anthony Park, Minn., by H. E. Cook, manager, who will look after Minnesota, North and South Dakota; at Terre Haute, Ind., by the Townley Stove Company, agents for Southwestern Indiana and Southeastern Illinois; at Ottumwa, Iowa, George Haw & Co., agents for Southern Iowa and Northern Missouri. Their traveling salesmen are C. E. Munsell, in Western New York, Western Pennsylvania and Eastern Ohio; W. A. Cunningham, Western Ohio and Eastern Michigan; O. E. Jennings, Central and Western Michigan; B. H. Cook, Northern Michigan; F. M. Northway, Indiana; J. C. Bump, Wisconsin; and A. Knobloch, in Illinois and Northern Iowa.

The Cook & Van Evera Company, Chicago, will be represented in Iowa by J. C. Shirra and J. B. Batchelder; in Illinois by J. M. Collins and A. P. Sweatman; in Wisconsin by C. M. Harmount, and in Minnesota, by A. Vogel. Others are to be appointed for Indiana and Michigan.

The Kling Stove Company, Gallipolis, Ohio, will be represented by James Gibson in the territory of Ohio and Kentucky and by William Kling in Indiana, and West Virginia.

The North Second Street Stove Salesmen's Association.

On December 30 a representative body of the stove salesmen from North Second street, Philadelphia, Pa., gathered at the Bourse Building for the purpose of organizing an association and at the same time to enjoy a banquet. The object of the association is to foster friendly relations between the salesmen in the trade. At the meeting the association known as the North Second Street Stove Salesmen's Association was organized, and the following officers were elected:

President, Harry E. Borzell.
Vice-President, William F. Habicht.
Secretary, W. G. Withers.
Treasurer, Horace Tyson.

After organizing the association and electing officers the banquet was served, and among those present were Walter Hallowell, J. Elwood Yeager, George W. Wagoner, Robert Warner, Joseph Evans, John Kryder, W. H. Borden, John Bell, George Uniacke, John R. McKnight, E. E. Reinking, Alexander Colquhon, John H. Hobday and F. Sabin.

Vice-President Habicht acted as toastmaster, and nearly all those present were invited to respond to some toast which contributed to the pleasure of the occasion. At its close all voted the affair a highly successful one, and arrangements were made for similar meetings annually. Representatives of J. E. Yeager, F. M. Borden & Brother, Mount Penn Stove Works, Colonial Stove Works, Mahood & Co. and F. Sabin participated in the affair.

Ringen Stove Company.

Catalogue 32 issued by the Ringen Stove Company, St. Louis, Mo., covers their line of gasoline stoves and blue flame oil cook stoves. It is a handsomely published pamphlet of 50 pages, bound in enameled paper, with the name of the firm and their trade-mark displayed on the title-page. Backing the title-page is a reproduction of the far famed picture of Vesta crowning the Quick Meal stoves and ranges with the laurel wreath and palm branch. In the announcement to the trade the company mention that for 1898 the Quick Meal stoves will be replete with all the features that have made them famous in the past, and that special attention has been given to all details and improvements so as to keep them fully abreast of the times. They have increased their facilities for prompt shipment, and now have a switch running right into their factory so that they can load direct into the cars. They make special allusion to their patent frame construction as being strong and of attractive appearance, and possessing very ample space for storing pans, vessels, &c., besides being easily kept clean. The Quick Meal Giant burner stoves have been improved, and it is said that there is no more liability of the valve becoming leaky after continued use. The lighting cups of all the Quick Meal Junior burners have had added to them a device which acts to make the lighting of the flame smokeless and almost entirely blue. Allusion is made to improvements in the Quick Meal oil stoves. The various Quick Meal goods are thoroughly illustrated and described in the pages that follow, and tables of prices and sizes are presented. At the end is reference to lamps and torches, saucepans, toasters, steamers, &c. A feature of the catalogue is the running index which appears at the top of the pages and facilitates reference to the contents.

J. D Marvin has opened a fine salesroom at 170 Centre street, New York, where he is acting as manufacturers' selling agent for a variety of special lines, which he is presenting as the Star lines. Mr. Marvin has his office

in the front showroom on the first floor of his building, which he has covered with a handsome red carpet, and has arranged his Stoves at each side, and at the back has erected a pyramid of Stoves. Three ranges are placed across the corners at the bottom, and on a platform which goes up to the top of the ranges are two more ranges, and on a still higher platform is another range higher up, giving a very pleasing effect. In the rear of this salesroom Mr. Marvin has a large showroom and on the floor above he has another large space. The Star lines are composed of the Stoves, Ranges and Furnaces made by the Abram Cox Stove Company; the Gas Stoves and Ranges made by the Electric Gas Stove Company, Detroit, Mich.; the Blue and White Flame Oil Stoves made by the Electric Oil Stove Company of Homer, Mich.; the Belding Refrigerators made by the Belding-Hall Mfg. Company, Belding, Mich.; the Gasoline Stoves and Iron and Brass Bedsteads made by the Western Hardware & Mfg. Company, Milwaukee, Wis.; the Hurd Refrigerators made by the Hurd Refrigerator Company, Duluth, Minn., and the Clothes Wringers made by the Ohio Wringer & Lawn Mower Company, Springfield, Ohio. Mr. Marvin is assisted in his new venture by Walter Barry and E. A. Keating as associate salesmen.

Method for Obtaining Weekly Shop Costs.*

BY W. N. MOORE.

The necessities of shop management with reference to current cost records are that they be practically accurate, continuously formed as a running record, always up to date within the shortest possible interval, and that the method be direct and inexpensive. The plan here given for recording labor and material costs has been in use for some years in a stove foundry, and has met these requirements. The various operations of the shop are classified, grouped, and, so far as desired, designated by separate numbers, which are known as shop numbers and are also used to designate corresponding ledger accounts.

As a matter of convenience, certain numbers are reserved for what are known as standing shop orders, which relate to constant operations, such as Cupola Attendance, Unloading Material, Care of Boiler and Engine, Repairs to Building, Repairs to Flasks and Machinery, Warehouse Labor, &c. Other numbers are reserved for Molding, Mounting, Nickeling, &c. Numbers between 1 and 10 indicate General Labor items. Those between 20 and 30, Machinery and Power; 300 to 400 indicate Mounting Shop Operations; 400 and above are used for special jobs, done either on shop account or custom work. These reservations add a significance to the numbers themselves and facilitate their proper use.

The day worker is furnished with a card such as shown in Fig. 1. On it he records daily the number of hours employed, and makes his own distribution of the time

JOHN SMITH, ...No.....

against the single or several shop orders under which he has been employed during the day. These cards are taken out in the morning and returned at night. He also registers on a Bundy time clock. At the end of the week the time reported is checked by the time clock record. The cards are computed vertically and horizontally, so that a workman's distribution of time must be complete, and is checked by the time paid for.

For piece work, a similar form is used, shown in Fig. 2. The workman is provided with a duplicate card for his convenience, but the real record is made by the timekeeper and foreman, using the ordinary means of a gangway count and discount pile. This is cumbersome, but no better way has been found.

At the end of the week, the computations having been made, the cards collectively form a complete pay roll. But, for the sake of convenience, the items are carried

Fig. 2.

forward and concentrated in a pay roll book in which are recorded the names of the workmen with the amounts due; and, under a separate tabulation, the various items shown on the card distribution are brought together under their common shop order numbers. The two sides of the pay-roll—the wages paid and the distribution—being in balance, the pay roll forms an accurate source from which ledger charges against the shop orders are made. These shop order accounts are carried in the ledger where they can be referred to when desired, and at the end of the year enter into an annual cost sheet with which we will not deal in this paper, but only with running records which are made and exposed as often as the pay roll is made up.

For the purpose of making ready comparisons, the weekly expenditures appearing in the pay roll under the various shop orders are then grouped under these headings: Superintendence, including watchman, power, &c.; General Labor, including yards, cupola, cleaning, grinding, &c.; Warehouse, Molding, Mounting, Nickeling, Repairs and Improvements. The castings made are of such uniform character as regards expenditures under the first three of these groups that such differences as exist are ignored. There are occasional exceptions where an undue proportion of gate, extra hazard from loss or breakage, or other conditions, require recognition, to fix individual costs. But for the purpose of this record these expenditures are charged uniformly against the product by weight, the basis of the charge being 100 pounds net production of finished castings, deductions being made for all returns to the cupola from whatever cause. The accuracy as to net product is insured by having all returned castings weighed back over the out scales and reported on the daily weight sheet. Liability to error is also decreased by having its weight plainly marked on each truck or barrow, and having the gross and tare both recorded.

A computation on the same basis is also made of the cost of molding, but as this is all done by piece work, and the cost per hundredweight naturally varies greatly according to the character of the work in the shop, the figures are only of general interest.

In the other departments—mounting and plating shops—where day work prevails, the natural costs of the various productions bear so little relation to their weights that comparisons on this basis would be valueless. There-

*Read before the Western Foundrymen's Association, at Chicago, Dec. 15, 1897.

fore, in ascertaining results being obtained in these departments there is first placed an arbitrary cost price, determined from previous experience, on each stove or piece produced. The weekly outputs of these departments are computed at these assumed costs, and the difference between this computation and the actual pay roll expenditure is shown as a percentage. This percentage of difference, either above or below the assumed cost of the weekly output, forms a very satisfactory gauge, both for making comparisons and ascertaining exact costs.

Those items in the pay roll which are grouped under Repairs and Improvements are not made a matter of weekly comparison, as expenditures in these directions are considered as arising more from general policy than from current shop management. They occupy a proper place in the yearly cost sheet.

Of the purchased material which enters into the production of castings, a comparative record of weekly consumption is kept of iron, coke and steam coal only. Iron and coke are weighed as they come up to the charging floor, and the daily weight sheet shows both the gross and tare of each load. Coal is similarly weighed to the boiler room. The materials so delivered are considered as consumed, although the actual daily consumption may only approximately tally. For obtaining an accurate record, this is found to be more reliable than a system by which the weighing is concurrent with the operation of charging, there being at most only a slight temporary inaccuracy in the weekly totals, due to the variation in the amount of surplus stocks which may remain on the charging floors at the weeks' ends. The weekly report shows the number of pounds of each of these several materials which have been used to produce 100 pounds of finished product. It also shows the total number of pounds melted, the returns of broken and discarded castings and the discount—each computed on the same basis.

The full report is as follows, the figures being entirely fictitious :

Week Ending January 1, 1898.

	Pounds.	
Net product	125,000	
Iron, per cwt. of product	94.4	
Coke, per cwt. of product	20.3	
Coal, per cwt. of product	5.7	
Total melt, per cwt. of product	157	
Breakage and obsolete, per cwt. of product	3	
Discount, per cwt. of product	4.5	
Group I.—Molding	$0.97	
Group II.—Superintendence, &c.	.124	
Group III.—General labor	.325	
Group IX.—Warehouse	.156	
Group V.—Mounting department	Gain, $32.50	9.7 %
Group X.—Plating department	Loss, 17.00	4.6 %

These reports are gotten out by Thursday, covering the operations of the preceding week. The remedial value of information of this character comes not only from knowing it, but from knowing it quickly.

The cost of clerical work involved in keeping this record, over and above that required for the simplest form of pay roll accounting, is not such as to affect its usefulness. The method has a natural fluency, one step following another in simple routine, and but little or no knowledge of the operations of the shop is required to carry correctly the original entries through to the conclusions.

Discussion.

W. Ferguson: I would like to inquire how long it took from the commencement of this system before you obtained satisfactory results ?

W. N. Moore: It has been in use for six or eight years. It proved satisfactory from its inception.

W. L. Thompson: While Mr. Moore says the figures in the paper are entirely fictitious, I would like to ask him if 94.4 per hundredweight is anything like the general average of casting produced from 100 pounds of melted iron.

Mr. Moore: I would answer that question by stating that the figures are entirely fictitious. They are not intended to convey anything as to actual results. At the same time if it had been 104.4 it would have made the table more nearly correct. That item is always in excess of 100 pounds. It takes more than 100 pounds to make 100 pounds of casting. Our records show that it takes about 104 pounds of iron to make 100 pounds of casting.

S. T. Johnston: I would like to ask Mr. Moore if he has the men extend the amount opposite their time ?

W. N. Moore: The men count their hours; the rest is done in the office.

O. T. Stantial: It is impossible for us to adopt any such system as this on account of the variety of work. It is all very well in a stove foundry or in a machine foundry, but where you are turning out all kinds of work you must keep special costs.

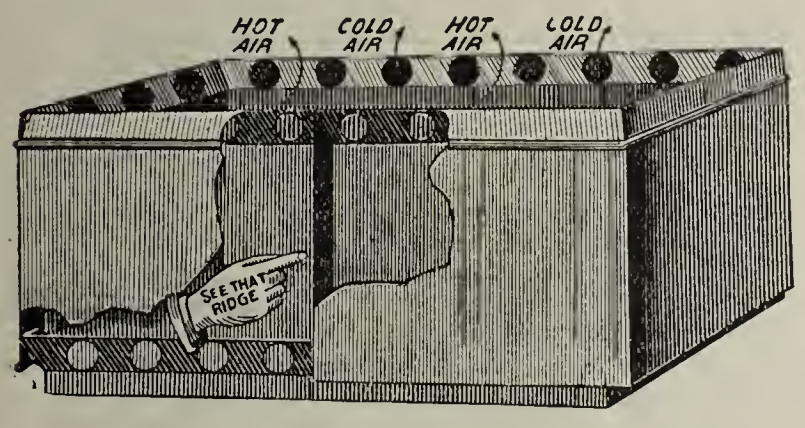
W. Ferguson: In the general foundry business we get cost per ton. Once after trying for 30 days to get a detail cost on every individual piece produced in the job we did not succeed. We were running at that time in the neighborhood of 130 molders, and hired a half dozen clerks to look after the system. I know now of another concern who get individual costs and they handle it in pretty good shape. From my own experience in the general foundry work I never saw the necessity for detail costs. It would cost more money to keep the system running than the gain therefrom is worth. In our system we divide the work into four classes. In the first class we put green sand, dry sand and loam work in the second class, hard iron in the third class and shop tools in the fourth class. The coremaker's time is taken for 30 days, and a report made on that basis always seems to me to be all that can be got out of it.

A. Sorge, Jr.: I cannot agree with Mr. Ferguson so far as the keeping of individual costs is concerned. It is not done merely for the purpose of estimating. A keeping of individual costs does give a record as to the expense; and, if it is done in a proper and systematic manner, it can be done with slight expense. I know where the keeping of costs for 120 molders involved the labor of one clerk. The individual cost of any piece produced in that shop was obtainable. As to trying a system of that kind for 30 days, I think our chairman will agree with me that that is not a fair trial. The longer it is kept up the more valuable it becomes. Methods can be judged much more accurately than by the judgment of an individual. Mr. Moore states that he gives a shop number to a certain stove: does that involve every piece of that stove or simply the stove entire ?

W. N. Moore: We do not have special shop numbers for the separate parts. There is a multitude of castings, and it would hardly warrant the effort to number each one separately. This description of our methods is not presented as one which is of general application. It was presented merely with the thought that it might possibly be of interest. The conditions in a stove foundry or in any shop making a specialty are of course radically different from those in a general foundry. It is not to be thought for a moment that a plan that will be satisfactory under one set of conditions is applicable to another set. In the three labor items, the Groups II, III and IX, especially Group III, a general labor item which includes the yard work, cupola and grinding, we have found a great variation. When we are running a large heat we need a large number of men, but when the heat is reduced two-thirds, then we have to drop off some of the men, and the practical value of knowing that is worth a good deal. The natural tendency in our shop is that when we are running a lot of men and the heat drops down to 40 or 50 per cent., we drop a man here and there, but we keep three-fourths or two-thirds of the men to do one-half or one-third of the work. A report of this kind brings that very forcibly to the knowledge of the office. There are some facts in connection with this method which might be of interest. If special work comes in from outside we attach a shop number to it. The cost of the casting we assume to be practically the same, but the other costs vary greatly. There are special shop numbers for those items and we enter them in the ledger accounts, and have them to ascertain the unusual cost on a set of castings. We can turn to the ledger at any time and find the actual expenditure on any class of work done.

W. Ferguson: Mr. Sorge states that the individual costs are not kept for the purpose of helping to make estimates on work. If it is not for an economical purpose wherein is there any benefit to be gained from the system ? I cannot see anything except a knowledge of the whole working of the concern being placed in the hands of the head of the concern instead of in the hands of the foreman or superintendent and left to his management.

A. Sorge, Jr.: It is not merely for the purpose of estimating, but certainly it is concerned in the estimating and does help in the reduction of costs, and is of as great importance in the very thing that our chairman brought out as anything, that of informing the head of the concern of the workings of the shop.



New Process Blue Flame Oil Stoves

are considered in an interesting way in an attractive catalogue which has just been issued from the press by the Standard Lighting Company of Cleveland, Ohio. These goods are for the season of 1898, and embrace not only the Blue Flame oil stoves, but also New Process oil heaters, torches, Globe incandescent lamps, toasters, ovens, &c. In presenting the catalogue to the trade the manufacturers call attention to the many "new and valuable features embodied in the present construction of the New Process Blue Flame oil stove." Reference is made to the safety and convenience of this form of construction, the economy resulting from its use, its durability and its attractiveness. The statement is made that the New Process Blue Flame oil stove is easy to understand, and as complete instructions accompany each stove the manufacturers urge both dealers and users to familiarize themselves with the directions before starting the stove in operation. As a rule the mistake is made of trimming the wicks too much, thus needlessly destroying them. No portion of the wick, the makers state, should be removed except the free carbon that collects on its upper edge. The charred portion of the wick proper should not be

disturbed or removed. All stoves are carefully tested for leakages and imperfections before shipping, the tank being detached before the goods are sent out, thus removing all strain while in transit and preventing any consequent development of leaks. The little catalogue is printed in a very attractive manner and is bound in colored paper covers, with a blue panel in the shape of a shield carrying the name and address of the company and an indication of the contents of the pamphlet.

The Rome Ventilated Wall Pipe.

In the accompanying illustration we show a section of the Rome ventilated wall pipe, made by George Rome & Co. of Carnegie, Pa. Special machinery is provided for the manufacture of the wall pipe, elbows, boots, register boxes, offsets, tees and reducers and other fittings required in hot air furnace work, so that the work is completed without the use of solder. The illustration shows an inner hot air pipe and an outer casing with an air space between, provided with perforations in the end caps to insure a free circulation of air. In order to prevent the collapse of the inner or outer pipe a ridge is placed at the center of the pipe, which can be seen in the broken view presented. This ridge is provided in all of the fittings made, as well as the entire length of the heating pipe. A special feature of the pipe and fittings is the dovetail connection and the perfect fit provided by the method of making the end cap, so that in erecting the work no time is lost through difficulty in making connections. The Rome pipe and fittings have, we understand, been used largely in the vicinity of Carnegie with highly satisfac-

The Rome Ventilated Wall Pipe.

tory results. The Rome goods have been brought to the attention of a number of architects, building inspectors and fire marshals, and are said to have met with their approval without exception. The firm will be glad to furnish circulars and prices to those who are desirous of becoming acquainted with the pipe, and will also furnish a short section of the pipe, so that the construction and the method of fitting the ends of the sections may be more fully understood.

Range Manufacturers' New Open End Brake.

To meet the demand for improved machinery made necessary by the advances in the manufacture of ranges, J. M. Robisnon & Co., 325-331 West Second street, Cincinnati, Ohio, have brought out an improved four-foot brake for the expeditious work of bending and flanging, in addition to which a four-sided figure can be bent with a continuous operation at the conclusion of the fourth and last bend, and can be removed from the upper end of the top clamp without marring its shape.

The top and bottom clamps and bending leaves are the three principal members of the machine. The top clamp, which is stationary, is for all ordinary bending and flanging; the bottom clamp, to which the bending leaf is journaled, is operated by two eccentrics, the peripheries of which come in contact with the under side of the bottom clamp, and by a movement of a lever, secured to the shaft on which the eccentrics are keyed, the bottom clamp will rise in a parallel line with the face of the top clamp and clamp the material with a powerful pressure, thus making it impossible to move with the application of the force required to bend it. To one end of the eccentric shaft opposite to the lever is secured an eccentric around which is a yoke, the upper end of which is linked to the left hand end of the top clamp. Having made the fourth and last bend to a four-sided figure, the top clamp is secured at the right hand end with a journal screw, with a two-armed nut on top coming in contact with the clamp. Releasing the nut will let the screw swing down out of the way, and a backward movement of the lever on the eccentric shaft will cause the top clamp to swing upon its journal near the left hand end, in which position the completed work is free to be removed. A reverse movement of the lever will return the top clamp, when it can be secured with the two-armed nut and screw. Another valuable feature referred to is that the top clamp is adjustable for light and heavy material, sharp or round corners. The brake is not complicated in its movement, and the one lever on eccentric shaft does the clamping and raising of the top clamp. The eccentrics are adjustable for more or less pressure and any wear that may occur. The width between the clamps when wide open is 1 inch or less, according to the movement of the eccentric lever. These new features, in combination with adjustability, quick movement, and the ease with which the brake can be handled, fulfill, the manufacturers point out, the requirements for the rapid manufacture of family ranges, while its comparatively low cost brings the brake within the reach of all who desire to bend soft sheet steel of No. 14 gauge or lighter in 4-foot lengths or less.

ODD PLATES.

Vanfleet & Nixon of North Wales, Pa., are about erecting new Stove works on Seventh street, Lansdale. The main structure is to be 30 x 48 feet, while the foundry will be 20 x 40 feet. John Kauflie has the contract for erecting the buildings, which will cost $5000, and will be situated on the Doylestown branch of the North Pennsylvania Railroad.

J. Bramley Oldershaw has acquired an interest in the Rapid Transit Stove & Furnace Company, Baltimore, Md., and the business will be conducted under the name of J. B. Oldershaw & Son, proprietors.

The Griswold Mfg. Company, Erie, Pa., were recently chartered, with a capital of $100,000, to manufacture Stoves and Iron Ware. The directors are M. Griswold, M. Griswold, Jr., M. E. Griswold and L. G. Selden of Erie, Pa., and M. Griswold of Lyme, Conn.

The Walker & Pratt Mfg. Company of Boston, Mass., closed their foundry at Watertown for a week on December 24 for the purpose of taking annual inventory and making such repairs as were found necessary. The company's new plant at East Watertown is now ready for occupancy, and it was hoped that they would be able to take possession immediately after the Christmas shut down. Owing to the press of orders, however, it is not expected that the removal will take place before the middle of February, when the work on hand is finished.

The following interesting item is taken from a New York paper: "A Detroit Stove manufacturer declares that English manufacturers buy a few American Stoves, and then steal the patterns and make a clumsy imitation of our Stoves for themselves. They are now using Stoves in England after the American patterns of four or five years ago."

George Rome & Co., Carnegie, Pa., are bringing to the notice of architects and Furnace dealers the Rome Ventilating Wall Pipe by means of an attractive calendar which they are distributing. The calendar carries on the card on which it is mounted a fine engraving showing the interior of a German cottage, while below it is a cut illustrating the special features of the Rome Pipe, and a brief description of the Pipe is likewise presented. The firm also make Galvanized Cornices, Finials and Skylights, and do tin and iron roofing.

One of the most tasteful souvenirs of the season that has reached our desk is the calendar for 1898 which the Presbrey Stove Lining Company, Taunton, Mass., are sending out. The main feature of the calendar is a beautiful art study of wild flowers mounted on a decorated card, 14 x 11 inches in size, and hung by a white silk cord. The name of the concern is inscribed in gold letters at the top and the calendar proper is attached by silken cords to the bottom of the card, a leaf being devoted to each month of the year.

The Champion Furnace & Stove Company were organized at Springfield, Ohio, on December 29, for the purpose of manufacturing Stoves, Ranges, Gas Burners, &c. The new concern are successors to the Dayton Furnace & Foundry Company. The president is S. W. Martin; vice-president and treasurer, T. D. Wallace; second vice-president, J. F. Carpenter, and secretary, I. F. McNally.

The Edward Miller Cornice & Roofing Company, Tacoma, Wash., have designed a Camp Stove for the Alaska trade and already, we understand, have more orders for it than they can fill. The name of the Stove is the Brotherhood Klondike.

In *The Metal Worker* of December 25 we mentioned the incorporation of the W. L. Armiger Mfg. Company, Baltimore, Md., as successors to W. L. Armiger & Co. The firm, however, are to engage in the manufacture of Refrigerators and not in the manufacture of Stoves, as we stated. The new concern will continue the wholesale or jobbing Stove business formerly conducted by W. L. Armiger & Co. in connection with the manufacture of Refrigerators, but will not operate a foundry.

The envelopes used by William H. Hill announce him to be the sole agent for the Magee Furnaces and Ranges at Marlboro, Mass., and with this envelope announcement is printed a half-tone engraving of the gentleman in question, the portrait proving beyond all doubt that Mr. Hill possesses that great and admirable quality of good nature. However, we must not linger too long upon the envelope used by Mr. Hill, but say a word about a New Year's card that he is sending to his friends. It has a very neat address made from the text of an actual piece of taffy candy, done up in tin foil and fastened to the card. How any one after eating this most delicious piece of confectionery can have any doubt of the truth of all Mr. Hill says, or can question the sincerity of his mellifluous good wishes, is more than we can understand. Any one interested at all in the Magee Furnaces and Ranges, or taffy, should send to Mr. Hill for particulars.

In a special extra number descriptive of and illustrating Troy, N. Y., the *American Journal of Progress* presents a brief outline of the leading industrial establishments, among the number being the Vedder Pattern Works, located at the corner of River and Hoosick streets, in the city named. The enterprise had its inception in 1835 and later N. S. Vedder became the proprietor. He was succeeded by Bascom, Galbraith & Co., and in 1884 H. Clay Bascom became sole proprietor. On December 13, 1896, he died and the business has since been conducted by the estate, with Chester Bascom as manager, Mr. Galbraith remaining, as heretofore, at the head of the mechanical department. The present works were those formerly occupied by the Eddy & Corse Stove Foundry, and are equipped with all the latest steam power machinery and appliances for the manufacture of Wood and Iron Patterns, Stove Work, Hot Air Furnace, Radiator Patterns, &c.

In addition to the list of their traveling salesmen given in our issue for December 25, 1897, the S. M. Howes Company of 40-46 Union street, Boston, Mass., announce that Fred Hall will look after their interests on Cape Cod and contiguous territory.

Schill Brothers of Crestline, Ohio, have issued an attractive calendar of the poster form, which will be appreciated by all dealers who receive it. The figures are large, and as they are printed in a dark color upon a white ground they can be readily seen at a distance. The moon's phases are given in connection with the days of the week and month. In presenting their annual calendar to the trade the manufacturers state that their sales of Furnaces and Ranges during 1897 were the largest in the history of their business, and notwithstanding several additions to their plant the past two years they were unable to keep up with the demand. They also state that ever since 1892, when they commenced the manufacture of their well-known New Idea Furnace, their sales have increased year by year, and the Furnace is to be found to-day in nearly every State in the Union where Furnaces are employed for heating purposes. The manufacturers contemplate still further increasing their producing facilities and hope to be able in the future to keep up with the demand.

We have received from Isaac A. Sheppard & Co., Philadelphia, two illustrated cards printed in colors, which are well calculated to direct the attention of those who receive them to the Paragon Furnaces and the Excelsior Ranges.

F. M. Borden & Brother, 118 North Second street, Philadelphia, Pa., are already bringing to the attention of the trade the Novelty Blue Flame Oil Stove which they are making a specialty of this year, and also the New Process Gasoline Stove. Morris Borden is now making a trip in the South showing these goods, W. F. Habicht is visiting the dealers in Pennsylvania and C. B. Smyth is traveling in New Jersey.

F. Sabin, 121 North Second street, Philadelphia, Pa., has a fine large showroom in which he is displaying the Active Fortune Ranges and Hot Air Furnaces, which goods have had a long and successful run with the building trades in that vicinity.

Manager J. C. H. Lynn of the Danville Stove & Mfg. Company, 107 North Second street, Philadelphia, Pa., has an attractive display of the Beaver line of Ranges and Parlor Heaters, and the trade in Pennsylvania is now being visited by H. Harfield, and that in Delaware and Maryland by W. E. Pharo.

John R. McKnight, manager of the Philadelphia office of the Mount Penn Stove Works, 113 North Second street, reports a good trade on the Penn Coin, Penn Pride and Penn Pearl Sheet Iron Stoves of the direct draft, half revertible and full revertible flue types, made with clay fire chamber and sheet iron body. These Stoves are attractive in design and provided with handsome nickel trimmings. He is also showing a fine line of Square Heaters in the Penn Oakland, and a very successful Double Heater of the sheet body type in the Penn Ruby. One of his newest attractions is the Penn Esther, a large, handsome Range provided with all of the modern conveniences.

E. F. Kurtz, 43 North Second street, Philadelphia, Pa., is preparing to bring to the notice of the trade the Quick Meal line of Blue Flame Oil Stoves, Gasoline Stoves and Steel Ranges. C. S. Stevens is about starting on a trip through Pennsylvania, and W E Hopkins for a trip in the South. The line of Stoves made by the Buckwalter Stove Company of Royersford, Pa., is the line of coal goods which he handles

The Loyal Victor, one of the newest Ranges put out by the Leibrandt & McDowell Stove Company of Philadelphia, Pa., is of handsome design and finish and provided with all the conveniences necessary to qualify it to stand in the front rank. The circular distributed by the house says that it is made in 48 sizes and styles, and one of the pictures shows the body of the Range and displayed in front of it are the various parts which time and experience have proven liable to need replacing, showing that it is a simple matter to renew any of the parts compared with the labor that was necessary with the Stoves of an early date.

A miniature United States mail box, in the orthodox red color, calls attention to the new departure of the Monarch Stove Company, for whom A. L. Canfield, 284 Pearl street, New York, is manager. The announcement alludes to their large showrooms and warehouse and their facilities for prompt shipment, and gives a list of some of the new goods for 1898 which they are putting out, besides emphasizing the merits of the Monarch oven.

Rufus Van Valkenburgh, representing Eugene Munsell & Co., New York City, Stove founders and miners of Mica, sends a novel and interesting announcement to his friends in the trade wishing them all joy for the coming year. The card is tastefully designed, and will be read with interest.

W. G. Henry, secretary of the Detroit Stove Works, has succeeded W. M. Shaddinger as manager of the company's branch house at Chicago. Mr. Shaddinger retains his official connection as second vice-president.

R. L. Morley, associate manager of the Michigan Stove Company, Chicago, is again at his desk, having returned from his trip to Europe last week. He made but a short stay, having sailed the latter part of November, and not having gone for personal pleasure. His trip was uneventful, no seriously rough weather having been encountered either on the outward or inward passage.

Bergstom Bros. & Co., Neenah, Wis., are distributing artistic wall calendars with heavy paper backs, embossed in gilt and brass bound. The monthly sheets are of large size, with very distinct figures.

A combination has been arranged of some 20 of the largest concerns operating the fresh water fisheries of the Great Lakes. The amalgamation is taken over by an English company, capitalized at $5,000,000. The new organization will control the distribution of about 150,000,000 pounds of fish a year and will operate cold storage plants in a number of the principal cities.

A tremendous rush of applications was experienced during the closing days of the year at the Patent Office in Washington, the number filed exceeding the highest on record for the season in the history of the office. The fact that the new law, requiring persons who have made applications abroad for patents to file their applications in this country within seven months of the filing of the application for a foreign patent, became operative January 1, is accountable for the rush. Heretofore applications could be filed at any time within the life of a patent issued in foreign countries.

After a lengthy trial a verdict was returned last week in Judge Seaman's Court, in Chicago, in the breach of contract case of the Columbus Construction Company against the Crane Company, awarding $98,086 damages to the Crane Company. The basis of the suit was an alleged breach of contract upon the part of the Crane Company, who had secured the contract for furnishing the pipe for the line of the Indiana Natural Gas Company, between the latter's wells and Chicago. The Columbus Construction Company originally claimed $1,000,000 damages, but later reduced this to $200,000. The Crane Company brought a cross damage suit for $130,000. The trial just concluded was the third and, besides, the case has twice been through the Court of Appeals.

The California Miners' Association are preparing resolutions for presentation to Congress in favor of the creation of the Cabinet office of Secretary of Mines and Mining. The resolutions will be sent to the American Institute of Mining Engineers and to the Federation of Miners for their indorsement.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Little or nothing more than ordinary business has been effected. Consumers and the distributing trade purchased very conservatively, and no speculative interest has developed despite the officially recorded change in the statistical position. The latter places the visible supply for Europe and America on the 1st inst. at 29,855 tons, against 31,037 tons on November 1, and 32,342 tons a year ago. The market maintained a firm tone, however, and prices showed no change. Jobbers continue to quote small lots of Straits Pig from store at 4½c. to 4¾c. per lb.

Copper.—Neither export nor home trade buying has been of remarkable volume, but a very good business takes place quietly and sellers hold more or less firmly to full former prices. It is figured out that the December exports amounted to 10,305 tons, making a total of, in round numbers, 123,000 tons of fine Copper for the entire year. In the face of this heavy movement and the large American production, the European visible supply has decreased to 32,000 tons, leaving what may be termed a healthy statistical position. Under the circumstances prices hold quite steady here. In a retail way business during the week has been of very limited proportions, and dealers' prices for small lots are unchanged at about 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—Consumers' orders have been confined, as is usual in the first week of the year, to small lots for current needs. The larger users of Sheet Copper have not yet figured out their probable requirements, but the amount of inquiry during the last few weeks indicates the probability of a good sized demand in the near future. Competition for orders is somewhat sharp and prices for Sheet Copper are hardly as firm as for the raw material. Small lots from stock are quoted nominally at 15c. per lb., basis, but this price is not infrequently shaded on desirable orders.

Pig Lead.—Business has been slow throughout the week, and the market is at present in a flat condition, with orders of a very moderate type. Improvement is looked for, however, as soon as consumers and dealers have figured out their requirements. Prices, while somewhat weak, show no quotable change. Jobbers quote small quantities of American Pig at 4⅛c. to 4¼c. per lb.

St. Louis advices are as follows: The market is dull, but prices are firmly maintained. The demand is expected to improve shortly, especially as consumers are known to be carrying light stocks, and some improvement in the price is also anticipated.

Lead Pipe and Sheet.—As noted in another column, the Eastern manufacturers of Lead Pipe and Sheet Lead have reduced the price of these materials ¼c. in the lb. Jobbers now quote Pipe at 5½c. and Sheet at 6½c., subject to the customary trade discount of 20 per cent. Sales have been on a very moderate scale in the past week, orders being almost solely for spot goods for present use. A better business is looked for as soon as concerns have completed their stock taking.

Spelter.—The demand is very tame, and as offerings are rather freer the market has relapsed into weakness. Retail prices for good Western brands in small lots are quoted by dealers at 4.40c. to 4½c. per lb.

St. Louis advices indicate no change in this metal. The demand in that quarter is only fair and sellers are offering large lots at a reduction from last week's prices, without finding many takers.

Antimony.—Sales have been fair and prices remain steady at about 7¼c. for Japanese, 7½c. for Hallett's and 8½c. for Cookson's in small parcels from store.

Nickel.—The market is easy at about 38c. per lb. for retail quantities.

Tin Plate.—The first week or two of a new year are at all times regarded as dull ones in the Tin Plate trade. Stock taking is in progress and calculations are being made by dealers and consumers as to future requirements. Consequently the run of sales has been small during the past week. Nevertheless, some fair sized contracts were placed for American Cokes for deliveries extending into the second quarter of the year. The prices at which these orders were taken are said to be low, however, and the tone of the wholesale market is not as strong as it might be. This is somewhat surprising, as a number of the mills are sold up to May and available stocks of Plates are by no means heavy. The prospect of a large additional output this year is undoubtedly the depressing influence in the market. But, as has been pointed out several times in these columns, this additional capacity will not be much of a factor until after the middle of the year and, meanwhile consumers will have to get their orders for the year's supply filled from the present active mills. When this fact is appreciated by buyers there is likely to be a great stimulus to the demand, which should tend to stiffen prices. The retail trade has been dull, with sales confined to small lots for current use. The trade are interested in the meeting of the manufacturers' committee this week in Pittsburgh, as it is rumored that efforts were likely to be made to advance prices to a more profitable level by means of an agreement among the makers such as was made last year. Jobbers' prices for small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but these rates are being shaded in some quarters: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3 60; do., 100 lbs., $3 40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates remain very quiet and unchanged.

Sheet Iron.—While orders have been rather scarce during the holiday weeks, there is said to be a large amount of figuring going on on contracts for deliveries extending up to the middle of the year, and a heavy demand for Sheets is looked for during the early months of the year. Mills, however, are showing a disposition not to sell for delivery beyond the first quarter, believing that prices may improve when the spring trade opens. Meanwhile, the market for spot goods is hardly firm. Jobbers' sales have been very light. Small lots from stock are quoted at about 2.35c. to 2.40c. for No. 27 Common Black Sheets, and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: Manufacturers who can make the deliveries find a good trade for carload shipments this month and February in both Black and Galvanized Sheets. Small lots from stock are held at 2.20c. to 2.25c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—There has been a slight improvement in the demand and inquiries indicate a better business as the month progresses, both from domestic and foreign consumers. Meanwhile prices are unchanged. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb.	9 c.
Light and Tinned Copper	per lb.	8 c.
Heavy Brass	per lb.	5¾c.
Light Brass	per lb.	4¾c.
Lead	per lb.	3½c.
Tea Lead	per lb.	3¼c.
Zinc	per lb.	2¾c.
No. 1 Pewter	per lb.	8 c.
No. 2 Pewter	per lb.	4½c.
Wrought Scrap Iron, per gross ton		$10.50
Heavy Cast Scrap, per gross ton		9.25
Stove Plate Scrap, per gross ton		5.25
Burnt Iron, per gross ton		5.00
Tin Plate Scrap, per ton		4.50

The citizens of Greenville, Pa., have purchased $15,000 worth of bonds, this being the amount necessary to insure the starting of the Greenville Rolling Mills of P. L. Kimberly & Co. at that place. It is probable the plant will be started this month.

The Excelsior Stamping & Metal Company of New York City have been incorporated, with a capital of $30,000, to manufacture Metal Ware. The directors are Seuder Jarmulowsky, Meyer Jarmulowsky and Louis Jarmulowsky of New York City.

THE IRON MARKET.

The tide is rising surely, although almost imperceptibly. The main channel is full and we may soon find the river overflowing its banks. In many branches, notably in the cruder forms, the rush for winter work is over and the leading sellers are well filled with orders for the next three to four months to come. The business has been taken at low prices, modestly remunerative to the best equipped and located works, and for some time to come they will probably remain indifferent, willing to let events shape their course until buyers again come into the market. The conviction now is quite general that by that time sellers will be in a position to demand an advance.

Concerning the Wire consolidation there is very little that is new. It is understood that the work of the appraisers and accountants is progressing more rapidly than was expected, and that there will be a gathering of those interested in this city during the close of the current week. The application for an Illinois charter, with a capital increased from the original $70,000,000 to $87,000,000, indicates that some large interest must have been added to the first coterie. The sum is suggestive.

In the Central West the makers of Billets are booked well up to May, and the only activity recently has been in Sheet and Tin Plate Bars, which show a stiffening tendency.

Considerable additional business has been done in Philadelphia in Foundry Iron, and at other points round blocks have been sold to Pipe makers. On the whole, in the East the market has settled somewhat. Along the belt west of the Alleghanies, where Southern and Northern Irons struggle for supremacy, there is still some irregularity and the largest buyers are still skirmishing.

Pig Iron.—There has been some local buying in the New York market of round lots by Pipe works, and there have been sales to Malleable works aggregating about 8000 tons. There is quite a good run of small orders. We quote as follows: Northern brands. No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

Advices from the Philadelphia Pig Iron market are as follows: The prominent feature during the past few days has been the steady absorption of low grade Iron by the Pipe founders. It is asserted that not less than 50,000 tons has been taken by one firm, besides which a considerable amount of Iron has been engaged by smaller concerns. Prices have been very low in these transactions, yet general quotations are fairly maintained on the usual run of business. Looking at the matter from a seller's standpoint, it may not be very inspiriting to contemplate sales of so much Iron at low prices, but they have unloaded a great deal of material, and are now in better position to present a firm front on whatever business may now be offered to them. The year opens with extremely low figures, but taking all the circumstances into consideration the situation is full of encouragement, and in course of a few weeks it will be strange indeed if prices have not developed a new upward tendency. For the present seaboard quotations are about as follows, subject to the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11.

Seldom, if ever, has a year opened with brighter prospects in the Chicago market Numerous inquiries are in the market, and the month is likely to see a large tonnage closed. The business of the past week was more than fair, including sales of both local and Southern brands. The slight weakness in some Southern Irons is likely to disappear speedily with the good demand now in full swing. Stocks of Iron at Southern furnaces are stated to be lower than they have been at any time for six years. The leading Southern companies maintain a firm attitude, and their agents are instructed to refuse any concessions whatever. The local furnaces are now so well sold up for the first half of this year that it would not take much more business to completely cover their capacity. The Charcoal Iron trade continues quiet. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.00 to 11.50
Southern Coke, No. 1	10.75 to 11.25
Southern Coke, No. 2	10.35 to 11.00
Southern Coke, No. 3	10.10 to 10.60
Southern, No. 1 Soft	10.75 to 11.25
Southern, No. 2 Soft	10.35 to 11.00

The Pig Iron market in Pittsburgh has been very quiet, but prices are firm. Foundry Irons show no change. Quotations f.o.b. Pittsburgh are as follows: No. 1 Foundry, $10.50 to $10.75; No. 2 Foundry, $10.10 to $10.25; Bessemer, $10 to $10.15.

In the Cincinnati district there has been a moderately fair run of new business, made up mainly of small orders, with some very fair sized lots helping to swell the total. There is but little in the indications to justify weakness on the part of furnaces, yet the market is unquestionably soft in some places. There are quite a number of buyers in the field, all seeking to force the market down and holding off in an aggravating manner when concessions are not granted. There has been some activity in Northern Irons, with evidence that the furnace interests up there need a vigorous tonic to give strength to their situation. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to ....
Southern Coke, No. 3	9.00 to . .
Southern Coke, No. 1 Soft	9.75 to ....
Southern Coke, No. 2 Soft	9.50 to ....
Southern Coke, Gray Forge	9.00 to ....
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to $13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The month of December was the heaviest, so far as volume of business is concerned, which the St. Louis Pig Iron trade have experienced for years past. It is true that in some cases concessions were made to induce the placing of orders, but in no case did it amount to more than 25c. per ton, and in most cases was even less than this figure. Prices have eased off somewhat during the past ten days, and the entire list shows an average decline of 25c. per ton. The outlook for January is considered excellent. Furnaces have no stocks to draw from, and many of them are sold up several months ahead. Consumers are specifying for their Iron, and a number of instances are known of shipments being asked for before they were due. The consumptive demand in all lines continues to be heavy, and nearly all the foundries have enough work on hand and in sight to anticipate a continuance of the activity for the next 90 days if not longer. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.25 to $10.75
Southern, No. 2 Foundry	10.00 to 10.25
Southern, No. 3 Foundry	9.75 to 10.00
No. 1 Soft	10.00 to 10.25
No. 2 Soft	9.75 to 10.00

CHICAGO REPORT.

Scrap.—A little inquiry for Old Material is making itself manifest and is regarded as the forerunner of an early revival in the demand. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—Trade is dull and prices are still being made under the card rate. The card on carload lots of 12 tons minimum is as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo.	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

While the trade have entered upon the new year they are still largely occupied with the business of 1897, taking inventory, closing the books and estimating the results of their activity and enterprise. Many of them are able to recognize the advance which the past year made over its predecessors and are congratulating themselves on somewhat increased profits. The new conditions, however, while unmistakably better, have not as yet given to many houses the desired measure of prosperity, and a retrospect of the past calls for careful scrutiny as to the methods adopted with a view to discovering the mistakes which have been made, cutting off expenses, finding new channels for business and introducing a general and better system wherever needed in store or factory, so as to make the business of the year more profitable and satisfactory. Every wise merchant or manufacturer will endeavor to adapt his business methods to the changing conditions of trade, or will be likely to find that he is being left behind in the race. In addition to many minor matters which deserve careful attention there is little doubt that the past year has been characterized by some features of especial significance. Among these the prominent place which department stores are assuming cannot be overlooked. The effect of their activity and enterprising methods and of the favor with which they are regarded by so many is felt by many merchants; while in this comparatively new field manufacturers and jobbers are finding a ready market for an increasing variety of goods. The system adopted by what are called catalogue or supply houses is also a disturbing influence in settled and old time business methods. In both of these matters the indications would seem to point to an increase rather than a diminution. What their influence will be upon trade finally remains to be seen, and it becomes all classes to look the matter fairly in the face and meet the new problems intelligently and energetically. During the past year there has been an evident tendency toward organization among the retail Hardware trade, and several States have associations in good working order. In others the matter is under advisement, and it is anticipated that organizations will soon be formed. Among the matters which have prominent place in the deliberations of these associations are the department stores and supply houses alluded to above, and many intelligent Hardware merchants are considering the question as to the measures which it is feasible to adopt to correct these disturbing influences. The different associations of the jobbing trade, who are especially well organized, are regarded as having had a satisfactory year and doing a good work in the cultivation of fraternal feelings and the inculcation of good business methods. During the year past there has also been, on the whole, something of a shrinkage in values in Hardware and related products, and the tendency toward lower prices has continued. Whether this is to go further or be checked by better business conditions and a large demand remains to be seen. In good measure, as a result of the low prices which have become prevalent, together with the enterprise of American manufacturers and the adaptation of their wares to foreign markets, there has been during the year a marked increase in the volume of foreign business. The extent of our general export trade is one of the gratifying features of the situation, and the large place in such exports held by Iron and Hardware products is a matter for special congratulation to the readers of this journal. The indications would seem to point to a much larger and more rapid movement in this direction, making the securing of foreign trade an object deserving the attention of manufacturers whose wares are such as to find a market abroad. This, with the outlook for excellent business at home, renders the prospect for 1898 specially encouraging.

Advices from Chicago.—General business in Shelf Hardware, Tinware and Metals opens up well in the new year, notwithstanding the fact that some jobbing houses are still entertaining their travelers at home. The orders being received by mail are of a very good character, indicating a tendency to keep up full stocks. A better movement is reported in staple goods, especially Wire products. The improving prospects for the consolidation of Wire interests are at last having an effect on the retail trade, who are beginning to purchase in carload lots. A special feature of local business is the very heavy demand for Galvanized Garbage Pails and Ash Cans, owing to a new city ordinance now going into effect requiring such receptacles by all householders. Manufacturers are hardly able to supply the trade within the limited time required. A good movement is reported in Heavy Hardware. The demand is excellent for Iron and Steel, and contracts are being placed for materials by certain classes of Agricultural Implement manufacturers.

Advices from St. Louis.—The Hardware trade opens up with a bright prospect. The month of December was very satisfactory and the reports received from salesmen who are now on the road indicate that the present month will prove equally if not more satisfactory than the one just closed. The recent advance in Screws is being firmly maintained. Wire Nails have also been advanced and slight advances have been recorded in Galvanized and Black Sheets. The trade do not hear much of the proposed consolidation of the Wire interests and are inclined to think that the matter will not go through. When it is remembered, however, that the work of appraisement cannot be done in a day or a week, opinion in this direction will probably change somewhat. The demand for Heavy Hardware is very large and an unusually heavy inquiry is reported for Builders' Hardware and Mechanics' Tools generally. Collections are quite satisfactory.

NOTES ON PRICES.

Wire Nails.—During the past week the demand has not been active, but prices have been steadily maintained. Manufacturers are refusing to accept orders except for early delivery at the present prices. The tone of the market is decidedly firm in view of the prospect for a successful consummation of the negotiations for the control of Wire interests.

Advices from Chicago.—Manufacturers report exceedingly heavy shipments in December, which probably witnessed the largest output of Wire Nails in the history of the trade. Heavy inquiries are being received, but in most cases buyers desire deliveries extending further than manufacturers are willing to grant. Jobbers quote small lots from stock at $1.60 and report a good movement. The retail trade is at last beginning to purchase larger quantities, and carload orders are becoming a feature.

Advices from St. Louis.—The market continues to show steady improvement and prices are being firmly maintained. Manufacturers are not inclined to fill their order books too full, but on the other hand are refusing business except for delivery during the current month. Jobbers report a satisfactory trade and quote $1.60, base, for small lots from store.

Cut Nails.—There is very little doing in Cut Nails, but it is anticipated that with the resumption of business activity when the trade of the new year is taken in hand there will be a good demand. Stocks generally are regarded as low. Quotations remain unchanged.

Advices from Chicago.—The demand is running about the same as it has for a long time, with small lots from stock selling at $1.45.

Advices from St. Louis.—The market is without any material change. Jobbers ask $1.45 to $1.50, base, for small lots from store.

Barb Wire.—The volume of business in Barb Wire is moderate, but the tone of the market is strong and the anticipations of the manufacturers are that a heavy business will be done this season.

Advices from Chicago.—Practically no stocks are in manufacturers' warehouses, which is quite unusual at this time of the year. It shows how heavy the shipments have recently been. A good trade is in progress, but quotations are still being made for immediate delivery only. Small lots are selling at $1.60 to $1.65 for Painted and 30 cents advance for Galvanized.

Advices from St. Louis.—There is not much doing in this department. Mills are not disposed to accept business for anything but immediate shipment. Jobbers report a fair demand and quote small lots of Painted at $1.60 to $1.65, with 30 cents per hundredweight added for Galvanized.

Smooth Wire.—The volume of business is not heavy, but the market is steady and strong.

Screws.—Since the concerted action taken by the manufacturers of Wood Screws, as announced in our last issue, the Screw market has been in excellent condition, the new prices being adopted by all the makers and received with approval by the trade as a reasonable advance on prices which had been unduly low. The manufacturers also refer to the fact that much less than the usual quantity of goods was purchased just prior to the advance, as a conservative policy was pursued by most of them,

and the trade were indisposed to buy in a speculative way. The fact of the advance coming as a natural reaction from unprofitable prices is having a good effect on the market at large.

Russell & Erwin Mfg. Company.—A discount sheet has been issued by Russell & Erwin Mfg. Company, New Britain, Conn., and New York, giving the revised quotations on Wood Screws and the new lists and discounts on Machine Screws, Iron and Brass, and current prices on Tire and Stove Bolts, Wire Nails, &c.

Machine Screws.—Under date January 1 the manufacturers of Machine Screws issue the following revised lists, which are subject to discounts as below :

	Per cent.
Round Head Screws, Iron or Brass	60
Flat Head Screws, Iron or Brass	60
Fillister Head Screws, Iron or Brass	50

Circulars announcing the adoption of the new lists and discounts have been sent out by the American Screw Company, Providence, R. I.; Russell & Erwin Mfg. Company, New Britain, Conn., and New York; Reynolds & Co., New Haven, Conn., and other manufacturers.

Sizes above 100 inches, $10 per box extra for every five inches.

An additional 10 per cent. will be charged for all Glass more than 40 inches wide. All sizes above 52 inches in length, and not making more than 81 united inches, will be charged in the 84 united inches bracket.

The price at which jobbers are to sell American Glass is to be decided by the American Glass Company, in conference with the jobbers. Such a conference will be held in the near future. Present sales are made at the prices to be decided upon. Complaints of jobbers cutting prices will be referred to the company for investigation and adjustment.

It is too early to say just what effect the new list will have upon the market, except that the net price will show an advance. It will be noticed that the new list is much higher than the one of May 1, 1895, and that there is a new arrangement of brackets. It is also higher, on the smaller sizes, than the French Glass list of September 20, 1897, which is now in use.

American Screw Company.—Under date January 1, American Screw Company, Providence, R. I., issue a discount sheet covering the varied lines of goods which they

Iron Machine Screws.

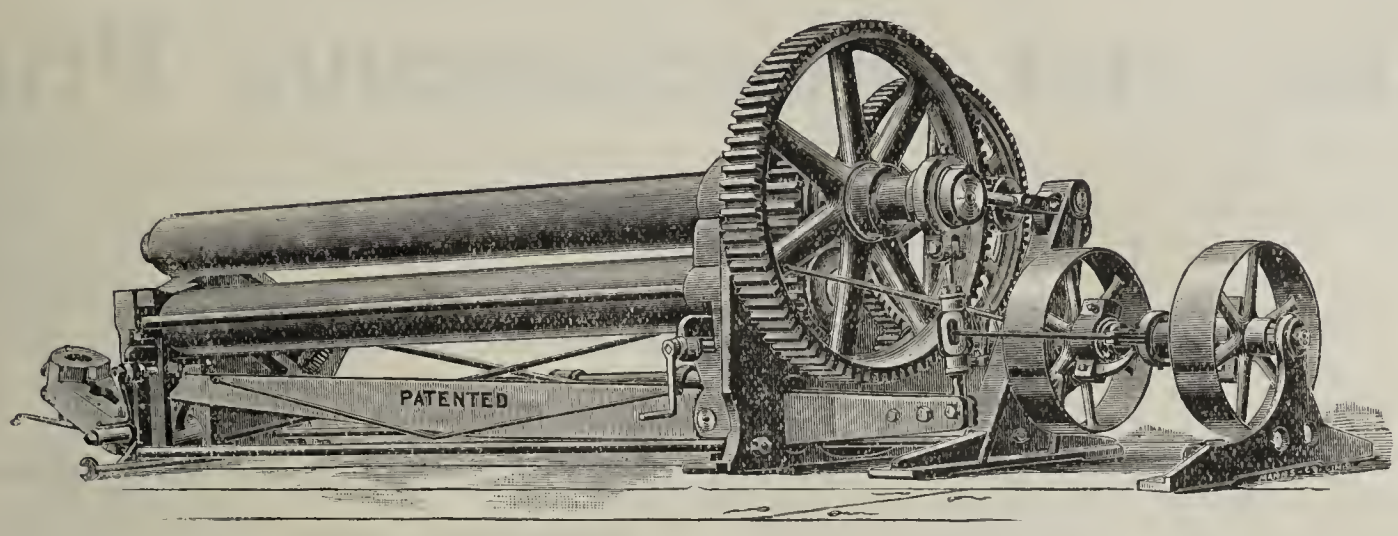
100	36x60	" 40x60	.....	.....	.....	.....	66.50	60.50	55.00

Lead Pipe, Sheet Lead, &c.—Under date January 3 the manufacturers of Sheet Lead, Lead Pipe, &c., announce the following prices, the reductions which are made being in sympathy with the tone of the Lead market:

	Per pound. Cents.
Lead Pipe	5½
Sheet Lead	6½
Tin Lined Lead Pipe	12½
Block Tin Pipe	30

White Lead.—A very fair business has been effected, mainly in the filling of old orders, but including some distinctly new business covering deliveries extending

over the next two or three months. Up to the date of this writing no change in prices has been announced by the leading corroders, and outside producers quite generally repeat their old quotations and terms.



Red Lead.—Little or nothing more than ordinary business has been effected in Red Lead, and prices for all grades remain without important variation.

Linseed Oil.—The position remains very strong, there being scarcely any reaction from the highest prices of the season nor anywise severer competition between local and out of town crushers. Buyers are operating in merely ordinary way, however, and take very little above what may be required to cover well defined wants.

Spirits Turpentine.—A fairly good business has been effected and retail prices are firm at 35c. to 35½c. per gallon for moderate sized lots.

Improved Bending Rolls.

We present an engraving herewith of an automatic opening, closing and self adjusting roll, put on the market by Bertsch & Co., Cambridge City, Ind. The large rolls can be easily opened and closed, it is stated, by one man in five or ten seconds, by simply disengaging and turning back the hinged housing supporting the top roll. This raises and supports the end of the top roll, and at the same time lowers the opposite end of the bottom roll sufficiently to release a formed plate of extreme width. This is accomplished by the steel lever beneath being operated by a lug on the lower end of the hinged housing and connected to the opposite end of both the top and bottom rolls. By this arrangement the top roll need be raised but little to release a formed plate, and the bottom roll aids in raising and supporting the top roll. The hinged housing, lever and top roll being so constructed as to be in balance, the machine is opened and closed with great ease, and as the adjustment of the lower feed roll need not be changed in the least after the machine has been opened or closed it becomes practically a self opening and self adjusting roll. The manufacturers point out that these rolls being of the initial style, with large and strong gearing and having the two front rolls geared, which gives a positive feed, and the top roll being smaller than that of the old pyramid style, much smaller circles can be formed in one operation than with that style of roll. It is mentioned also that plates can be bent very near the end. The machine illustrated is for 10-foot lengths of ⅝-inch plate.

Improved Bending Rolls.

In December the Oliver Wire Company of Pittsburgh galvanized 3901 net tons of Wire. This is claimed to be the largest amount of Wire ever galvanized in a similar time at any single galvanizing plant in the country. To the Oliver Wire Company belongs the distinction of having the largest single galvanizing plant in the United States, if not in the world.

According to a cable dispatch from London the Rothschilds of Paris and Vienna, in conjunction with the Russian oil refiners of Baku, are forming a company who propose to supply Great Britain with high flash Russian oil of 103 degrees, in competition with the Standard Oil Company.

Laird Brothers, the Clyde shipbuilders, recently launched from their yards the torpedo boat destroyer "Express" for the British Government, the largest and fastest destroyer afloat. Her length is 235 feet, and her speed is to be 33 knots an hour, equal to nearly 38 miles.

A contract has been awarded by the Government of Ecuador to American capitalists for the building of a railroad between Guayaquil and Quito, at a cost of $17,532,000. The road will be about 404 miles in length and will attain hights greater than that approached by any other railroad in the world. The starting point, Quito, is 9350 feet above sea level and the railway in its course will cross the Chimborazo range at an altitude of 12,300 feet.

It is a model of completeness and arrangement.

By far the most elaborate work of the kind published, and ***indispensable to progressive pattern cutters.***

All branches of Sheet Metal Work.

Price, Five Dollars.

Sent, post-paid, on receipt of price by

DAVID WILLIAMS COMPANY,
PUBLISHERS,
232-238 William St., New York.

Special Notices.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"

office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

FOR SALE.

A complete plant, Presses, Dies, &c., for making Seamless Tin Boxes, or would join with concern in kindred lines. Dies from 1 in. to 4¼ in. Address

"TIN BOX,"

office of *The Metal Worker*, 232-238 William St., N. Y.

FOR SALE.

An $8000 stock of Hardware, Stoves, Tin Stock, Furnaces, etc., located in Central Iowa, in a city of 10,000 inhabitants, the "livest" town in Iowa. Sale must be made by January 15 and must be for cash. Business has been established ten years. A rare opportunity for the right man. Address

HAW & McPHERRIN, Oskaloosa, Ia.

A VALUABLE INVENTION.

The attention of Stove manufacturers is called to the Down Draught, Fuel Saving, Smokeless Stove, especially constructed for burning soft coal, lignite, garbage, etc., saving 50% in cost of fuel over any other stove. Several other valuable principles are embodied in this great invention. We solicit correspondence from manufacturers to negotiate for the manufacturing of the stove.

SCHMIDT & CO.,
Room 610, 114 Nassau St., N. Y

—A BICYCLE company recently received the following letter from a Kansas man: "Deer sirz: "I live on mi farm near Hamilton, Kan., am 57 years old and just a little sporta. My neffew in Indiana bot hosself a new bisicle and sent me his old one by frate, and ive learned to ride sume. Its a pile of fun, but my bisicle jolts considerable. A feller came along yesterday with a bisicle that had hollow injun robber tires stuffed with wind. He leet me try hissen and mi, it run like a kushin! He told me you sell injun rober just the same as hissen. How much will it be to fix mine up like hissen? Mine is all iron wheels. Do you punch the hollow hole threw the injun robber, or will I have to do it myself? How do you stick the ends together after you get it done? If your injun robber is already holler will it come any cheaper empty? I can get all the wind I want out here in Kansas free.—Eberneezer Y. Jenson. P. S.—How much do you charge for the doodad you stuff the wind into the robber with and where do you start?"—*The Am. Field.*

—MISS NEW BOSTON—Mr. Simple, don't you find it difficult to decide whether the cell membranes of protoplasmic particles combine by cohesion or by chemical affinity?

Mr. Simple—No, ma'am. If anybody asks me troublesome questions I just say, "Well, in general I agree with Huxley and those fellows, don't you?" and that shut's 'em up, 'cause they never remember what Huxley does say.—*Judge.*

—HIS ADVICE.—Wife—Dear, the doctor says it is necessary for me to take a trip across the water. What do you think I would better do?

Husband—Get another doctor.—*Exchange.*

Iron and Steel.

This is the only complete work on the subject.

It gives practical suggestions in regard to the arrangement of the store—office, shelving, counters, racks, bins, sampling, window display, etc., etc.

It describes the practice of Hardware merchants in all parts of the country, and many different methods of accommodating and displaying leading goods.

Illustrations and detailed descriptions with measurements are given, so that Hardware merchants can readily adopt the methods described in the volume.

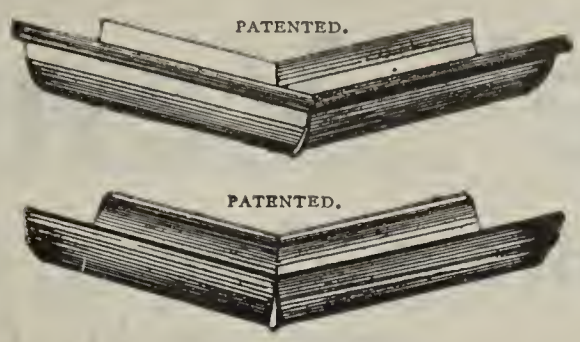
This book with its mass of practical and detailed information will be of great service—

To progressive Hardwaremen who are desirous of improving their stores;

To those who are intending to open new stores;

To those who want information as to the best methods of displaying and accommodating any given class of goods;

To those who wish to know how other merchants arrange their stores;



To those who are interested in the question of window display;

To those who are extending their business in any direction;

To those who desire practical suggestions in regard to the arrangement and sale of the different Hardware articles.

—LADY—"But it seems to me you ask very high wages, when you acknowledge that you haven't had much experience." Bridget—"Sure, marm, ain't it harder for me when I don't know how?"— *Tit-Bits.*

—JOHN SHERMAN'S FIRST MEETING WITH LINCOLN.—Secretary Sherman says he never will forget his first meeting with a President. It was shortly after Lincoln's inauguration and he attended a public reception, fell into line, and waited an hour or two for a chance to shake hands with the great emancipator. "During this time," says Mr. Sherman, "I was wondering what I should say and what Lincoln would do when we met. At last it came my turn to be presented. Lincoln looked at me a moment, extended his hand, and said: 'You're a pretty tall fellow, aren't you? Stand up here with me, back to back, and let's see which is the taller.'

"In another moment I was standing back to back with the greatest man of his age. Naturally I was quite abashed by this unexpected evidence of democracy.

"'You from the West, aren't you,' inquired Lincoln.

"'My home is in Ohio.' I replied.

"'I thought so,' he said, 'that's the kind of men they raise out there.'"— *Chicago Times-Herald.*

Tinners' Hardware and Roofers' Supplies.

BERGER BROS., - - Philadelphia.

Office and Stores: 231 and 237 Arch Street.
Factory near Germantown Junction.

It's reasonably sure

that the man who gives the most value for a dollar will get the best trade. Best value means the greatest worth. Now a 15 cent coffee pot, lasting only 15 weeks, will not bear comparison with a twenty-five cent article lasting 52 to 156 weeks. Housekeepers recognize this. Why not use GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES in your tinware and cater to 25 cent trade? There's more satisfaction, profit and credit in selling something you can guarantee, and the competition of cheap enameled iron ware does not affect you.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

GUMMEY, McFARLAND & CO., Philadelphia.

JAMES A. COE & CO.,

Nos. 106 and 108 Mulberry Street, Newark, N. J.

Iron and Steel, Structural Iron, Galvanized Sheet Iron, "Coe Old Style" Roofing Plate, Corrugated Sheet Iron, Heavy Hardware.

WE wish to call attention to the line of goods for which we are able at all times to quote most advantageous prices.

Our specialty is the manufacture of HIGH QUALITY ROOFING PLATES, and our Brands are known as the standard in their respective grades.

ROOFING TIN PLATE—BRANDS.

"Scott's Extra Coated"	"ABSOLUTELY THE BEST" 47 lbs. coating, and guaranteed to an extent unparalleled in the trade. Net weight, IC, 20 x 28, 240 lbs.
"Triumph Old Method"	Strictly Hand Dipped, Palm Oil process throughout, 38 lbs. coating. Greatly superior to other makers' best qualities. Net weight, IC, 20 x 28, 230 lbs.
"Protection Old Process"	A great favorite; bright clean finish, heavily mottled, 40 lbs. coating. Net weight, IC, 20 x 28, 230 lbs.
"Old Reliable Re-dipped"	Dull oil finish, well mottled, 36 lbs. coating. Very much preferred to the M. F. Brand, which is standard of best quality Welsh plate. Net weight, IC, 20 x 28, 230 lbs.
"Neville Old Style"	Very bright, clean and handsomely mottled, 26 lbs. coating, exceptionally rich in pure BLOCK TIN. Net weight, IC, 20 x 28, 220 lbs.
"Duquesne"	The highest standard of rolled roofing plates, has taken the position in America heretofore occupied by the foreign "Worcester" brand. Full weight.
"Pittsburg"	Next quality to Duquesne, and a favorite with many.
"Raymond"	A medium grade, suitable for ordinary work. Always sold at a very moderate price Full weight.
"Allegheny"	The lowest priced roofing plate we have to offer. You will be agreeably surprised at its quality, taking into consideration its low cost.

BRIGHT TIN PLATE—BRANDS.

"Finest"	The very best Bright Charcoal Tin. Superb coating, perfectly cleaned, closely assorted. "Finest" in name and quality.
"Clifton"	An excellent plate, well coated. "Melyn" grade.
"Furnace"	Medium quality, regular and light weights, also special sizes for Heater Pipe.

"FINEST" and "CLIFTON" brands in IC to IXXXX, 14 x 20 and 20 x 28, and also in many odd sizes.

PLEASED WITH OUR.. PATENT EDGE

THE CINCINNATI CORRUGATING CO., Box 314, Piqua, Ohio.

Dear Sirs:—I received the Patent Edge Corrugated Iron Roofing yesterday which I ordered from you on the 2nd inst., and must say that I am exceedingly pleased with the Roofing. I find it to be just as you represented it, and believe it to be cheaper than other Corrugated Roofing I have been buying at seemingly lower prices. I find your Roofing to be heavier than other roofing I have been buying and in all am well pleased. Thanking you for your promptness in shipping this order, and trusting that my future orders will receive the same prompt attention and goods equal those just received, I am,

Yours very truly, *JAS. N. ANDERSON.*

SYKES IRON & STEEL ROOFING CO., - Chicago and Niles, O.

—A LITTLE Sunday-school girl in the kindergarten class at Grace Baptist Temple very nearly demoralized the class, a few Sundays ago, by an ingenious remark upon the golden text set for that day. The text was from Acts xiii, 47: "I have set thee to be a light of the Gentiles," and, according to the method in vogue for impressing the lesson upon the young minds of the scholars, the teacher asked the children to tell what "light" was and what various kinds of lights there were. Several youngsters arose and said "lamplights," "gaslights," "candlelights" and so on. This little lady, who is destined for great things, suddenly got an idea, and she snapped her fingers vigorously to attract the teacher's attention. She was finally noticed, and the teacher asked, "Well, miss, what can you suggest as a light for the Gentiles?" The little girl, proud of her bright thought, spoke up as loud as she could: "Israelites!"—*Philadelphia Record.*

—A DRUMMER'S LAST RESORT.—"Look out, young fellow; what are you about?" said the policeman in a certain Southern town to a traveling man who was tapping with his cane with evident intention of smashing in the glass around a street lamp.

"Ah, there you are," said the traveling man, as the glass gave way with a crash. "Now, if you'll be good enough to arrest me, I will be obliged to you."

"You seem mighty anxious to get arrested," said the officer.

"Yes; I was a little bit afraid that you wouldn't notice me. I've got to stay here about three days till I hear from my firm on a business matter."

"Well, you don't want to spend that time in jail, do you?"

"Yes; I have tried both the hotels here."—*Exchange.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

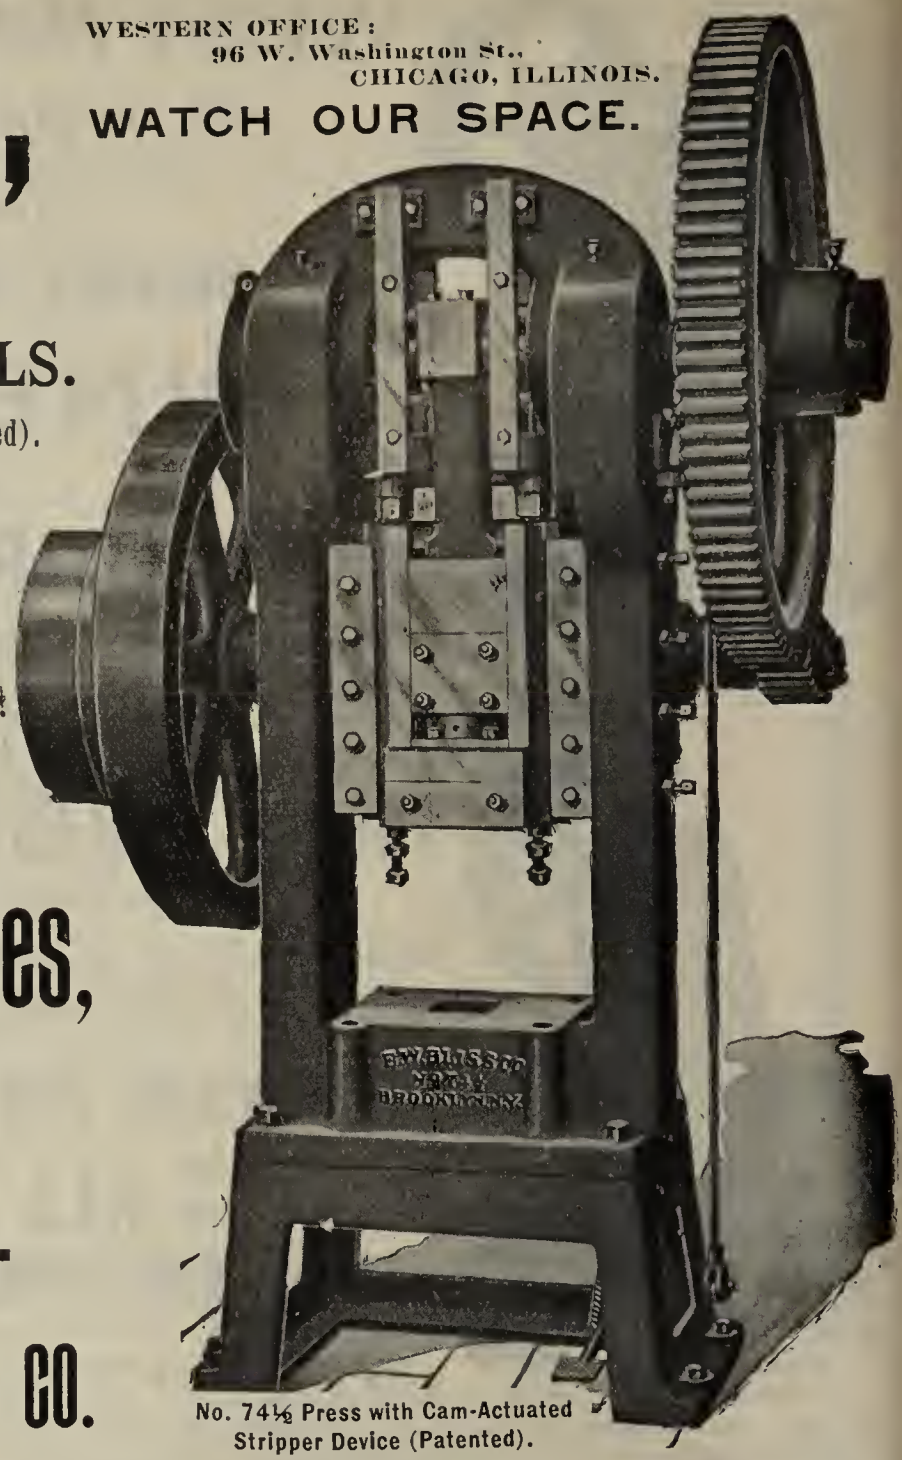
BICYCLE AND ELECTRICAL TOOLS.



No. 74½ Geared Press with Cam-Actuated Stripper Device (Patented).

It is well known that piercing dies having stationary strippers are liable to distort the plates which are pierced by them to such an extent as to require subsequent straightening. These stationary strippers are also a great hindrance to rapid and accurate work, the blank having to be placed under and withdrawn from them in a very inconvenient and time-taking manner.

By attaching the stripper plates to the stripper rods which receive their vertical motion through two cams on the shaft, a clear space is left between punch and die, enabling the operator to manipulate and observe his work quickly and accurately. The stripper plate comes down on the blank first, straightening and clamping it before the punches enter, and holding it under pressure while the punching and stripping is being done In this manner the work comes out perfectly straight and true. As the stripper plate moves up and down with the punches, they may be made shorter than a stationary stripper would admit of, making them considerably more resistant and durable.

A smaller hole in proportion to the thickness of stock may be pierced in this manner because of the close support which the movable stripper gives to the punches up to the point where they enter the stock

Write for further particulars. Correspondence Solicited.

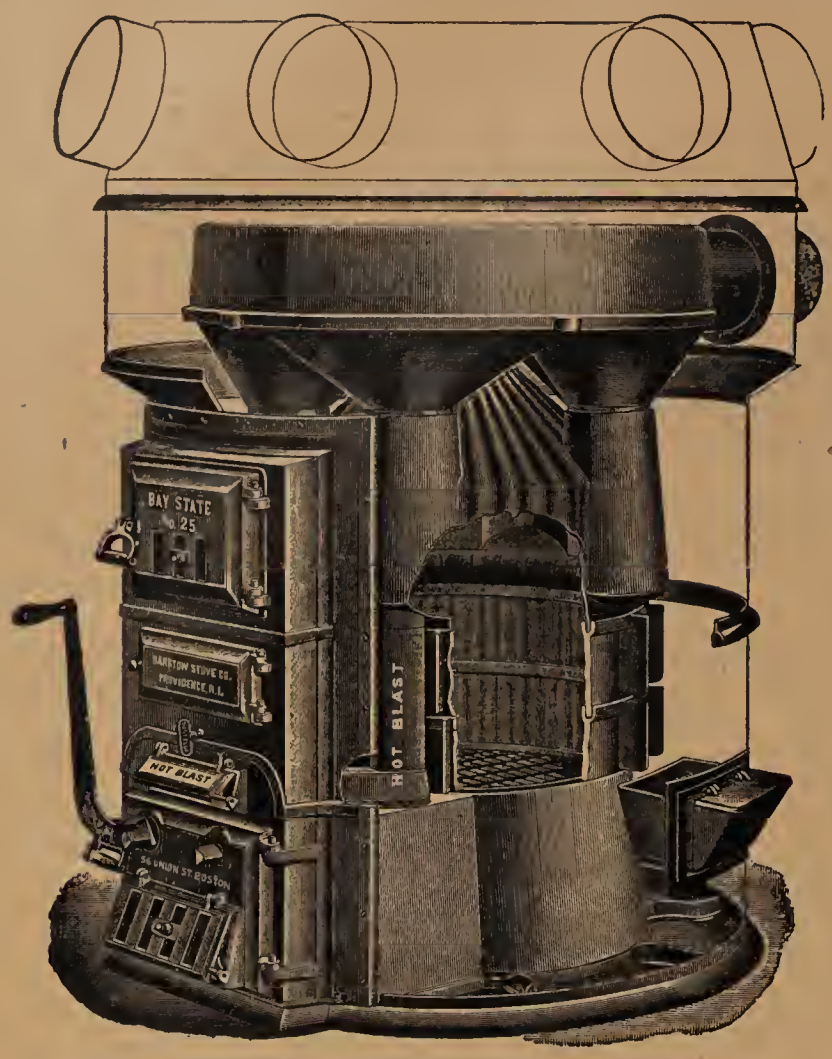
BRIDGEPORT, CONN.

—THE PROPER LENGTH.—A lawyer is presumed to be always able to suggest a difficulty, no matter how self-evident the case may seem; but the truly great lawyer knows how to state a point so that even a brother lawyer cannot start an objection. Stephen A. Douglas and Mr. Lovejoy were gossiping together, when Abraham Lincoln came in. The two men immediately turned their conversation upon the proper length of a man's legs.

"Now," said Lovejoy, "Abe's legs are altogether too long, and yours, Douglas, I think, are a little too short. Let's ask Abe what he thinks about it."

The conversation had been carried on with a view to Lincoln's overhearing it, and they closed it by saying:



"Abe, what do you think about it?"

Mr. Lincoln had a far-away look as he sat with one leg twisted around the other, but he responded to the question, "Think of what?"

"Well, we're talking about the proper length of a man's leg. We think that yours are too long and Douglas' too short, and we'd like to know what you think is the proper length."

"Well," said Mr. Lincoln, "that's a matter that I've never given any thought to, so, of course, I may be mistaken, but my first impression is that a man's legs ought to be long enough to reach from his body to the ground."—*New West Trade.*

PHILADELPHIA.

HATBORO, PA., Dec. 26th, 1896.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR:

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal. Very truly, I. N. EVANS.

1898.

To accommodate the increased demand for our product, we have found it necessary to add to our already extensive works. This new addition, just completed, will add to our capacity fully one-third, giving us one of the largest and best equipped Factories in this line in the United States, and will enable us to fill orders promptly, and at the same time can guarantee that everything will be of the best. Our line of

Gasoline Vapor and Evaporating Stoves and Ranges

will include our improved, celebrated "Gem" Vapor Stove, which, as now made, must become the leading stove in the market. We also make the Process, Single and Individual Burner Vapor Stoves of all styles and descriptions ; and our line of High and Low Juniors, including the Lay-down, the Removable and Stationary Tanks, which will in the future, as in the past, be the most popular in the market. We also call special attention to our celebrated line of

Blue Flame Oil Wick and Wickless Cook Stoves,

which are now in use in more than fifty thousand families throughout the United States, who all bear willing testimony of their durability, economy, simplicity, and quick-lighting, and dealers will find less annoyance and trouble in handling our lines than any other make. We are also pleased to call attention to our popular line of

Gas Ranges, Stoves, Hot Plates, Etc.,

which for quality, style and price are recognized as the most popular in the market, and, as heretofore, we shall continue to manufature ***Specialties,*** including our Combination Tinners' and Plumbers' Furnaces, Paint Burner, Blow Pipe, and Laboratory Lamps ; Gasoline and Oil Electric Torches, celebrated for their durability and quick-lighting.

We do not hesitate to believe that it will be to the interest of all dealers to confine their sales to our line of Vapor and Evaporating Gasoline, Blue Flame Oil, and Gas Stoves and Ranges, etc.

Separate catalogues for each line will be ready for mailing on or before the 15th of January.

STEAM AND HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.

AVOID MISTAKES AND LOSS
BY USING THE
CONTRACT and ESTIMATE RECORD BOOK FOR PLUMBERS.

By B. H. JESSUP.

OFFICE EDITION. (Second Enlarged Edition) 200 Pages. Arranged for 100 Estimates, size 9 x 12 inches, cloth, $2.00.

POCKET EDITION. 200 Pages. Arranged for 50 Estimates, size 3½ x 8 inches (oblong), flexible, cloth, $1 00

Plumbers will find the use of the Contract and Estimate Record Books a great saving in money and time.

These carefully prepared books offer a means of recording systematically and with little trouble each estimate or contract and will be of especial value to the trade because they give all the items in connection with each estimate, by which the danger of omission and error is avoided.

Each book contains a list of all material likely to be used in any ordinary house, and parallel columns give space for entering the cost.

OFFICE EDITION.

This edition is specially adapted for desk use The improvements and additions now introduced make this a perfect estimate book.

An alphabetical index is given in the front of this book for entering the names of those for whom estimates have been furnished, together with the number of the page on which the estimate is to be found in detail.

POCKET EDITION.

This book is printed on thin, strong paper, and arranged in the most compact and handy form for pocket use.

At the beginning of each form is a space for the name of the person for whom the estimate is made, and the date.

Plumbers will be well repaid who depart from old or imperfect methods of keeping track of work, and take these books into their shops for practical use.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

—CAPABLE DE TOUT.—Gentleman (in railway train)—How did this accident happen?

Guard—Some one pulled the bell and stopped the train, and the boat express ran into us. It will take five hours to clear the line for us to go ahead.

Gentleman—Five hours! I was to be married to-day.

Guard (a married man, sternly)—Look here, are you the chap who stopped the train?—*Tit-Bits.*

—A LADY, who is a city missionary, became much interested in a poor but apparently respectable Irish family named Curran, living on the top floor of a great tenement-house, in the slum district.

Every time she visited the Currans the missionary was annoyed by the staring and the whispering of the other women living in the building. One day she said to Mrs. Curran:

"Your neighbors seem very curious to know who and what I am and the nature of my business with you."

"They do," acquiesced Mrs. Curran.

"Do they ask you about it?"

"Indade they do, ma'am."

"And do you tell them?"

"Faith, thin, an' Oi do not."

"What do you tell them?"

"Oi just tell thim you are me dressmaker, an' let it go at that."—*Harper's Bazar.*

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00.

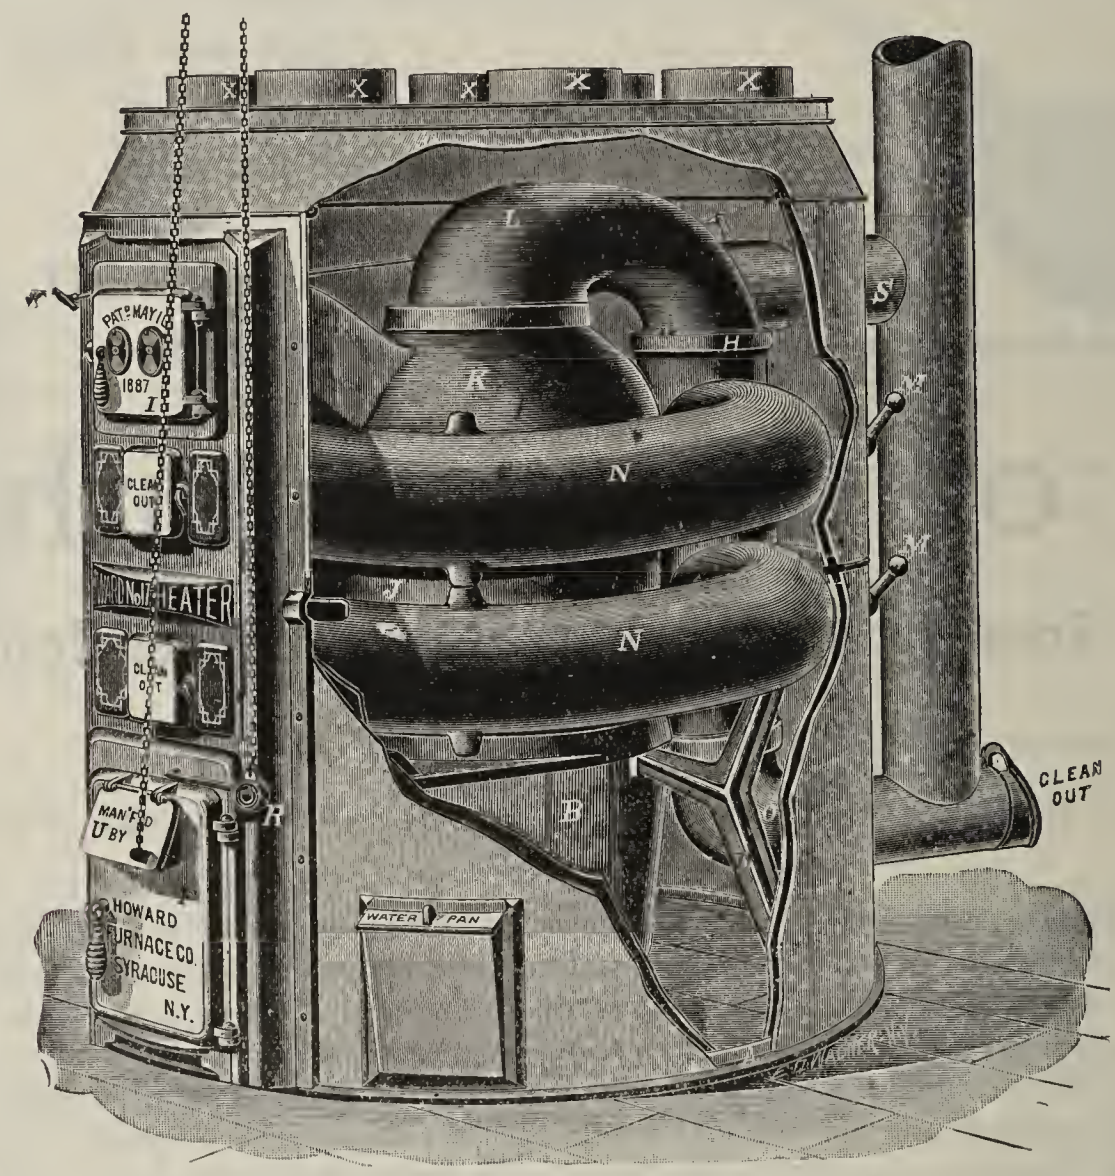
THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft.

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*

"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*



"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

DAVID WILLIAMS CO., Publishers, - 232-238 William St., N. Y.

Low Combustion Chambers

Furnace plate is forced to be raised to a higher degree of temperature under this construction than is possible to obtain when located away from the fire. It varies inversely as the square of the distance from the fire for effectiveness. This is illustrated by heating water near a fire and away from it. The same holds good with furnace plate for heating air. For this reason the Howard is made with a low combustion chamber.

High Combustion Chambers

are not fire surfaces. They lose in effectiveness in proportion to the space they occupy. It means practically a waste of iron. In other words paying for more material than is actually needed.

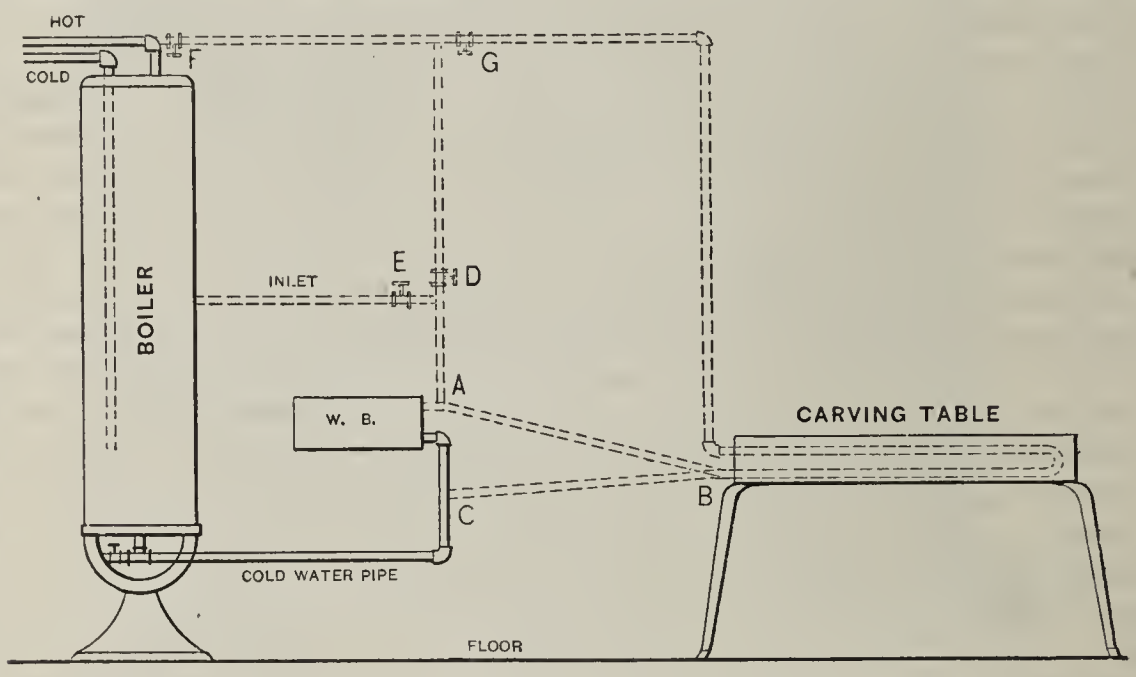
The Business Situation.

From all parts of the country come reports couched in the same tone, one of quiet confidence in the business outlook. The opening weeks of the year, while naturally a period of more or less restricted distributive trade, have seen active preparations for busy times ahead on the part of merchants and manufacturers. Activity, commercial and industrial, is looked for with an assurance not felt for years past, and a generally hopeful feeling pervades trade circles. The week just closed witnessed a distinct revival of activity and of cheerful confidence in Wall street, with prices of securities materially higher than at the opening of the year. An encouraging feature of the stock market was the renewal of heavy investment buying by the public and large purchases of American securities on foreign account, indicating confidence in the financial situation. Last week's record of bank clearings showed a remarkable volume of business, surpassing the figures of any previous week. New York's clearings alone, which were the heaviest ever known, amounted to over $1,000,000,000, exceeding last year's figures for the corresponding week by 37.4 per cent. and the first week of 1892 by 10.7 per cent. Outside New York the amount for the five days was over $536,000,000, bringing the aggregate clearings for the week above $1,679,000,000, an excess of 11.4 per cent. over 1892, the last really active business period. A satisfactory feature of the week's business, which tended to swell the amount, was the very unusual promptness and volume of the January commercial settlements, which were the heaviest ever known here. Railway earnings make a most gratifying showing, being over 12 per cent. better than a year ago. Encouraging activity is noted in the iron trade. The enormous production of pig iron which is going on, amounting to nearly 1,000,000 tons a month, is accompanied by a rapidly growing demand which promises to absorb the entire current output, and the possibility of a shortage during the current year is being seriously discussed. Prices of products are without important change in any direction, but the general tendency is toward firmness all around, with advances in a few directions. The metal trade remains quiet, but pig tin has advanced under the influence of a better demand, and lead is decidedly stronger. Exports, although comparatively light after the extraordinarily heavy December movement, are still going out in good volume. Grain shipments last week were 10 per cent. above those of the corresponding week of 1897, and the foreign demand for breadstuffs promises to keep up in good volume.

Southern Progress.



In spite of two very serious drawbacks—the yellow fever scourge, with its accompaniment of quarantine restrictions, and the low price at which cotton has been selling—the year 1897 was one of material progress in the South. That section of the country has been making substantial advances along many lines of commerce and industry in a quiet but steady fashion for the past few years. The business depression of 1893-1896 was less felt in the Southern States as a whole than in any other section of the country. Consequently they were in good shape to benefit by the improvement in general trade which was developed last year, and in that improvement they took their full share. A notable development, which holds the promise of important material advantage to the South, is the extension of cotton manufacturing in that region. This movement received a considerable stimulus last year, a number of cotton factories having been erected or their construction begun, while negotiations are now on foot looking to the transference of some leading interests in this line from New England to the South. With cotton factories established right alongside the field of supply of the raw material, the South promises before long to come to the front as the leader of the world's cotton goods business. At the same time the Southern iron industry has been making noble strides. Its production of pig iron in 1897 is estimated by the *Tradesman* to have reached 2,250,000 gross tons, or 450,000 tons more than the product of 1896. The comparatively cheap cost at which the Southern iron masters have been able to produce their iron has enabled them not only to extend their sales throughout this country, but also to make a beginning of what promises to prove a very large foreign trade. Along with the growth in iron production, new mills, foundries and machine shops have been established throughout the South, and are gradually filling the needs of that section for iron and steel products. Moreover, there has been a marked increase in diversified industries, as well as in a diversification of agricultural products, a very important point in offsetting the tendency to overproduction of cotton. The timber and mineral resources of the South are being developed very satisfactorily. Wood working factories are growing in numbers, and the furniture manufacturing business is becoming a leading industry of the South. Some of the products in this line have already found an export outlet. The Southern coal trade of 1897, with an estimated output of 30,000,000 tons, was the largest by far in its history, as was also the manufacture of coke in West Virginia. Railway facilities have been extended and improved to a notable extent, and the Southern States are now as well supplied with transportation facilities as almost any section of the country.

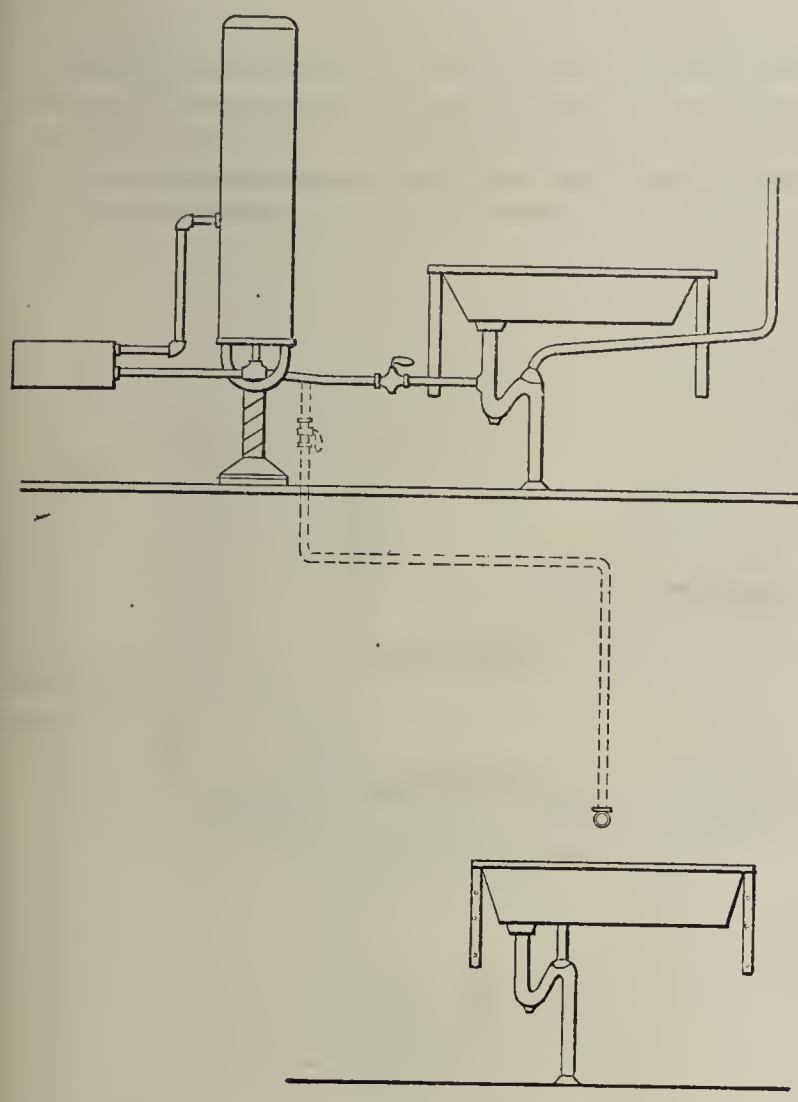
THE LETTER BOX.

Connecting Range Boiler with Carving Table.

From H. & H., Bedford, Quebec.—Will you please inform us the best way to make connections with a carving table so as to heat from a range boiler? The inlet to the heating coil in the carving table is 10 inches lower than the outlet of the water back. We show in the sketch presented herewith the relative arrangement of the water back, heating coil in the carving table, and the boiler. The heating coil is to be submerged in the water chamber of the carving table.

Answer.—The pipe from A and B, as shown in the dotted lines, should be removed. As it is likely that at times the fire will not be sufficient to furnish the hot water required in the boiler and to heat the carving table at the same time, it is best to arrange the carving table so that either one or the other may be used as required. A pipe should run from A to a point level with the inlet at the side of the boiler, where a branch should be carried

Connecting Range Boiler with Carving Table.



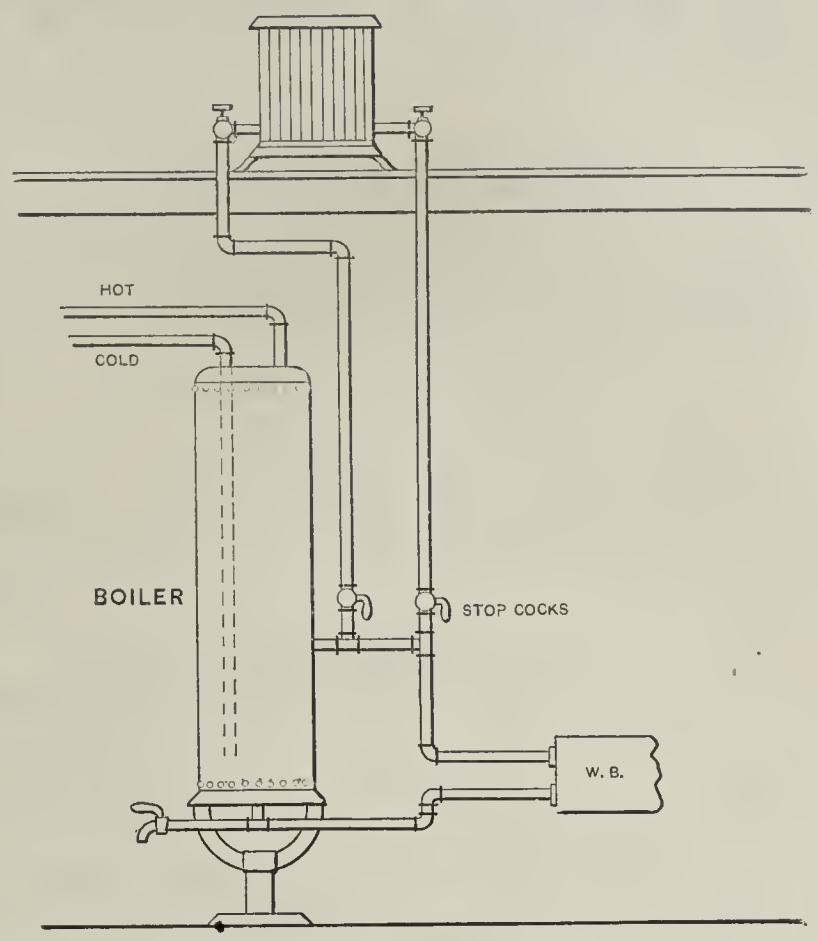
over to the boiler. The upright pipe should then be carried up to a point level with the hot water service pipe at the top of the boiler, and here a T should be placed and from one side of the T connect the hot water service pipe. From the other side of the T a pipe should be carried over to a point above the inlet to the heating coil in the carving table, where it should drop down and connect with the coil. The return from the heating coil in the carving table should be brought over from B and connected with the cold water pipe from the boiler at C. If the water back has sufficient power to heat both the boiler and the carving table it is quite probable that if used for the carving table alone too much heat would be generated at the carving table unless the coil was very large. For this reason a valve should be placed on the vertical pipe at D, so as to force the circulation into the boiler and then up through the boiler to the hot water service outlet, when it would cross over to the heating coil and return to the coil and the water back through the pipe connected at C. If it was desired to shut out the boiler entirely a stop cock should be placed at E and another at the top of the boiler at F. Then by opening the cock D the circulation would be through the vertical pipe and over to the pipe which dropped down to the heating coil and through it back to the water back. Any expansion in the water heated would work through the cold water pipe in the boiler against the service pressure. By leaving out the stop cock at D and placing a stop cock at G the pipe connecting with the side of the boiler might be omitted, which would enable a quicker supply of hot water to be secured.

Is It Dangerous?

From H. J. P., New York.—I have seen the letters of "O. & P.," in *The Metal Worker* December 11, and of "J. T.," December 25, 1897, in reference to connecting a water service pipe with the house drainage system, and while I have never seen just such a connection as is presented in the article of "O. & P.," that which is described by "J. T." as being desired by his customer is common practice in New York. It is not only desired by the general public, but also by the plumber. If a plumber is sent to a house, and in order to make repairs it is necessary to empty the boiler, it is a slow and tedious job to empty the boiler a bucketful at a time after the water supply has been cut off. It can be done quicker and with far less labor if the sediment cock under the boiler is connected by means of a pipe with the sink waste, and from the fact that in the best jobs of plumbing in the finest houses in New York such a connection is made, it would seem that it is not objectionable from a sanitary standpoint. My experience in the plumbing business covers a period of more than 25 years and I do not know when I first saw such a connection, but that it is common is well known to all who have worked in New York City. Up to the present time I have heard no complaints of sickness resulting from this practice.

From Oliver Twist.—The connection of the sediment cock or blow off pipe from the range boiler to the sink waste is one of common occurrence, but not in the manner shown in the sketch accompanying the letter of "J. T.," Hackensack, N. J., in *The Metal Worker* of December 25. When connected as shown in the sketch herewith it conforms to the regulations of most cities. Connect it on the house side of trap, with the stop cock as close as may be convenient to the waste. The objection is raised that if the stop cock be left open, &c. Suppose the plumber in cleaning the main trap of the house in cellar or basement forgets to replace the cover of the hand hole. What would happen? Both are acts of negligence, and should not occur. Even if the

cock be left open for a while it will be seen by the accompanying sketch that the sewer gas is intercepted by the sink trap. If it can be done, however, it would be preferable to use a few feet more pipe and continue to the basement, where it would terminate with a flap valve over a sink or other trapped fixture. In some cases it will be necessary, in order to obtain a fall from the boiler, to lower the sink trap so as to be able to connect on the house



Is It Dangerous?

side of it, but it will be only a few inches at most. The dotted lines show the blow off connected to sink in basement.

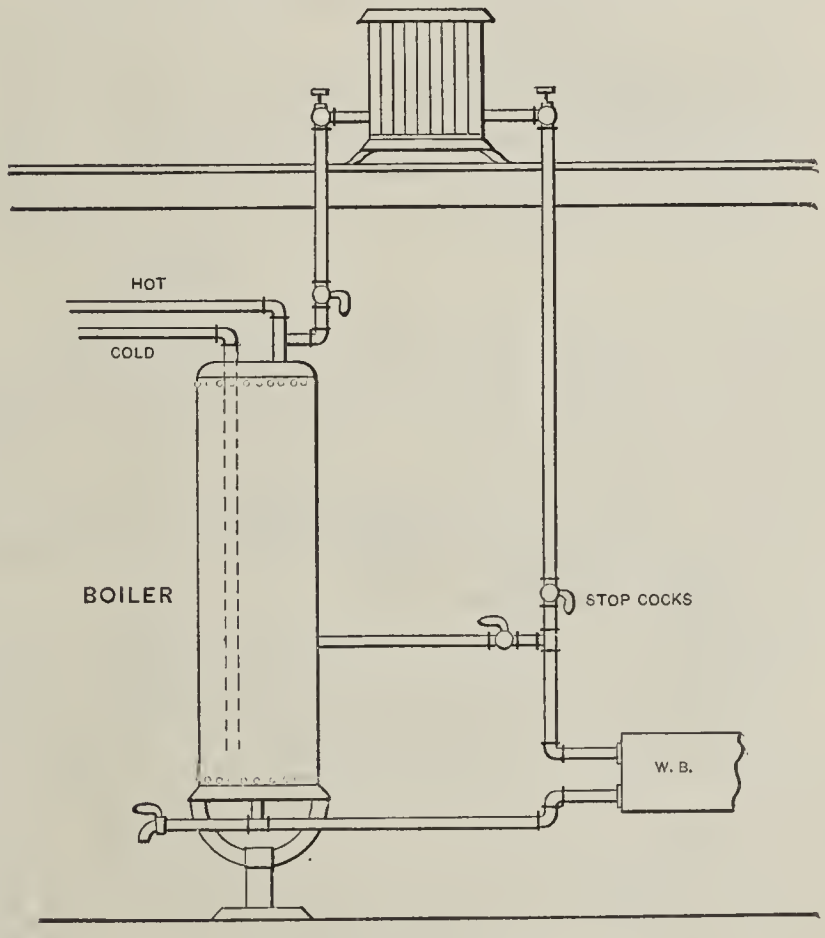
Heating Radiator from Range Boiler.

From E. G. H., Pottsville, Pa.—I saw in the book entitled "Kitchen Boiler Connection" an arrangement to heat a room from a boiler with hot water, and have arranged the system as shown in Fig. 1, which seems to work first class. I think, however, by connecting the return pipe at the top of the boiler and the hot water pipe, as shown in Fig. 2, it would work still better than when the return is carried to the side of the boiler. It is generally claimed that water can be heated quicker by connecting the hot water pipe from the water back to the top of the boiler instead of on the side. With the method shown in Fig. 2 the pipe that leads to the side of the boiler is to be used only in the summer time, when no heat is required in the radiator above. This pipe might run across at the top of the boiler, but the connection at the side of the boiler seems to give satisfaction for ordinary hot water service. I should like to know which of the two methods of piping is preferable.

Note.—Doubtless some of our readers who have systems in operation could give some information on this subject. Of the several systems illustrated in "Kitchen Boiler Connections" our correspondent has taken one which was open to some criticism. Of the two systems which he refers to, that shown in Fig. 2 is the better one. Both, however, might circulate more freely if there was not a possibility of the hot water on rising separating and flowing in both the flow and return pipes to the radiator. Under ordinary circumstances the hot water will rise in the first pipe that affords an opportunity, although in Fig 1 the flow and return connections are so close together that hot water might rise in the return pipe and impede the circulation. In Fig. 2 there is less possibility of trouble from this cause. In the system shown in Fig. 2 the hottest water would immediately rise to the radiator, and on cooling would return to the boiler, and the circulation of the system would take place through the boiler.

Heating Radiator from Range Boiler.—Fig. 1.—A System in Use.

In this way the hottest water returning from the radiator would be stored in the top of the boiler for use for domestic purposes. This method would insure the best efficiency of the water back for heating the radiator, but might interfere with the supply of hot water for other purposes.



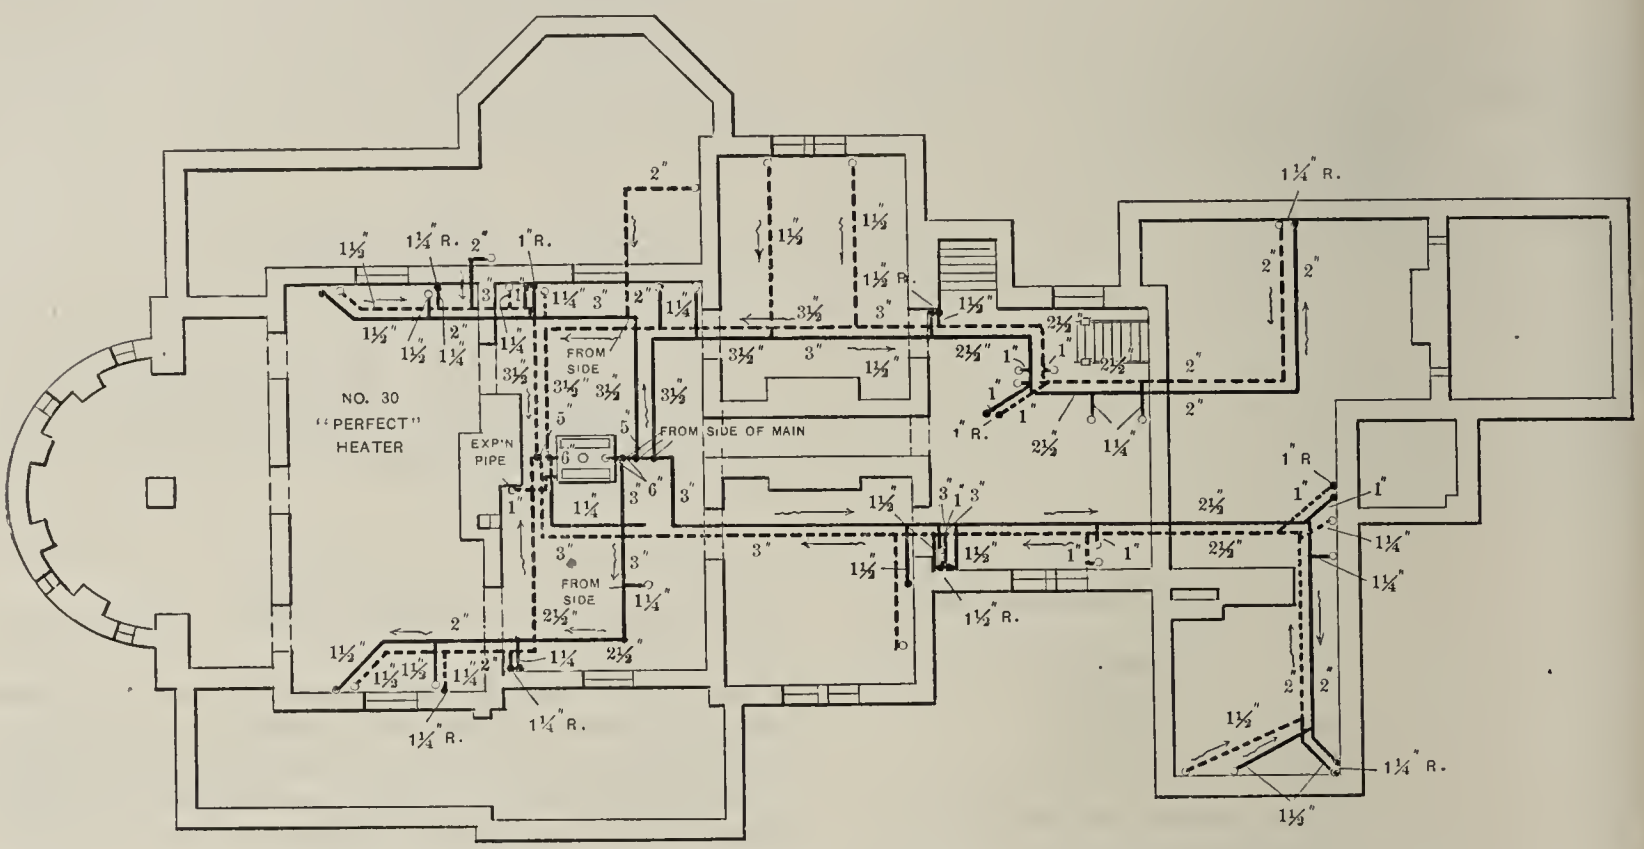


Fig. 2.—A Proposed Change.

Should such a condition arise, the return from the radiator should connect direct with the lower pipe at the water back, and the valve on the pipe supplying the radiator could be closed sufficiently to cause a circulation through the boiler as well as through the radiator. Connecting a water back, a boiler and a radiator affords opportunity for making many combinations, and the conditions and requirements make a satisfactory arrangement in one case open to improving changes in another.

HEATING AND PLUMBING.

A TWO-PIPE HOT WATER SYSTEM.

The question of exposure is one that receives careful attention from the competent heating engineer, and ample radiation is supplied to meet the cooling effects of the outdoor atmosphere on buildings which are located in exposed situations. The residence of Mrs. Thomas L. Kane, located on the side of a mountain at Kane, Pa., is so situated that the heating system must be equal to warming the building not only under conditions of extremely low temperature but also where the exposure increases the work to be done. The heating system, installed by the Kane Plumbing Company of Kane, Pa., is of the two-pipe hot water type, using a No. 30 Perfect boiler, made by the American Boiler Company of Chicago and New York. Fig. 1 is a plan of the basement of the building showing the location of the boiler and the method of piping. Fig. 2 is a plan of the first floor giving the dimensions of the different rooms heated and the proportion of radiation to the space heated. Fig. 3 is a plan of the second floor, which also gives the location of the radiators, the space heated and the ratio of radiation to the space heated.

A Two-Pipe Hot Water System.—Fig. 1.—Basement Plan, Showing Arrangement of Mains and Branches

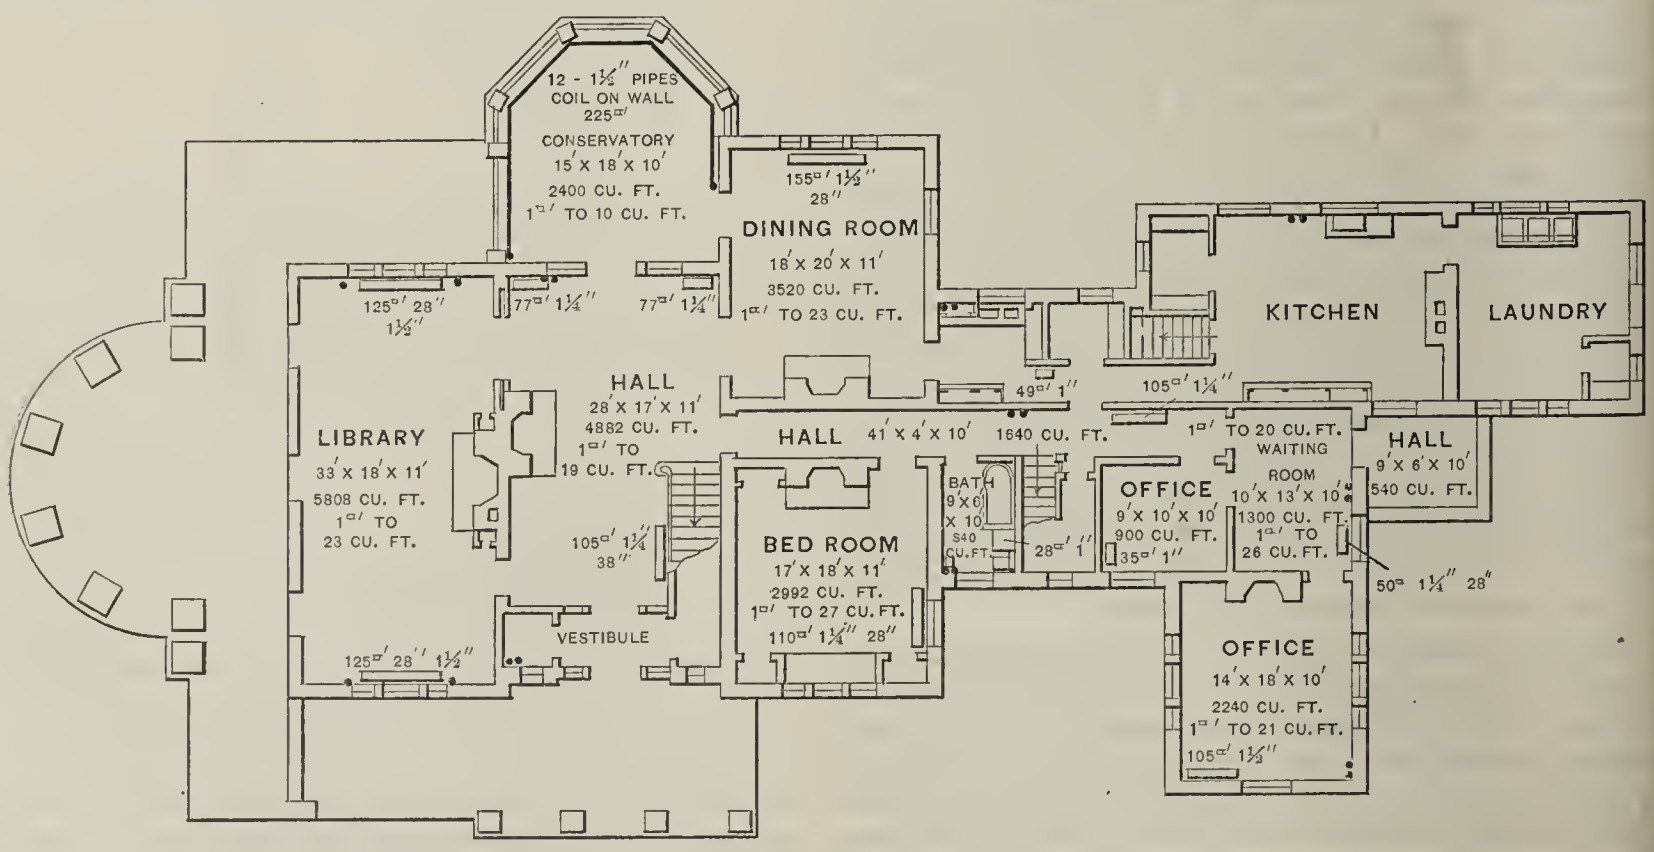

Fig. 2.—Plan of Firs. Floor.

In this plant a special tapping is provided in the boiler so that a 6-inch flow main is taken off the front of the boiler, which is at the right side of the plan. From this main the various branches are taken as shown. The re-

turns from the various radiators are also shown and their sizes given. The returns are indicated on the plan by a dotted line nearest the wall of the building. With this information the student of this heating system may more readily follow the piping arrangement. The radiators used are of the Zenith pattern, made by the Titusville Iron Company, Titusville, Pa., and 152 Centre street, New York, so that in addition to the direct radiation afforded the flue construction of the radiators secures a circulation of the air in the room. On the first floor there is a conservatory, in which is a coil having 225 square feet of surface, and it will be noticed that 1 square foot of surface is provided for each 10 cubic feet of space in this conservatory. It will also be noticed that the radiation provided in the first-floor rooms, with the exception of the bedroom, is 1 square foot to about 23 cubic feet of space, except in the main hall, where more radiation is provided, inasmuch as it is expected that some heat will be lost in passing to the second-floor hall. On the second floor the proportion of radiation to space heated is 1 to 27, with the exception of the larger nursery, where the proportion is 1 to 22, three sides of this room being exposed, and it has therefore been

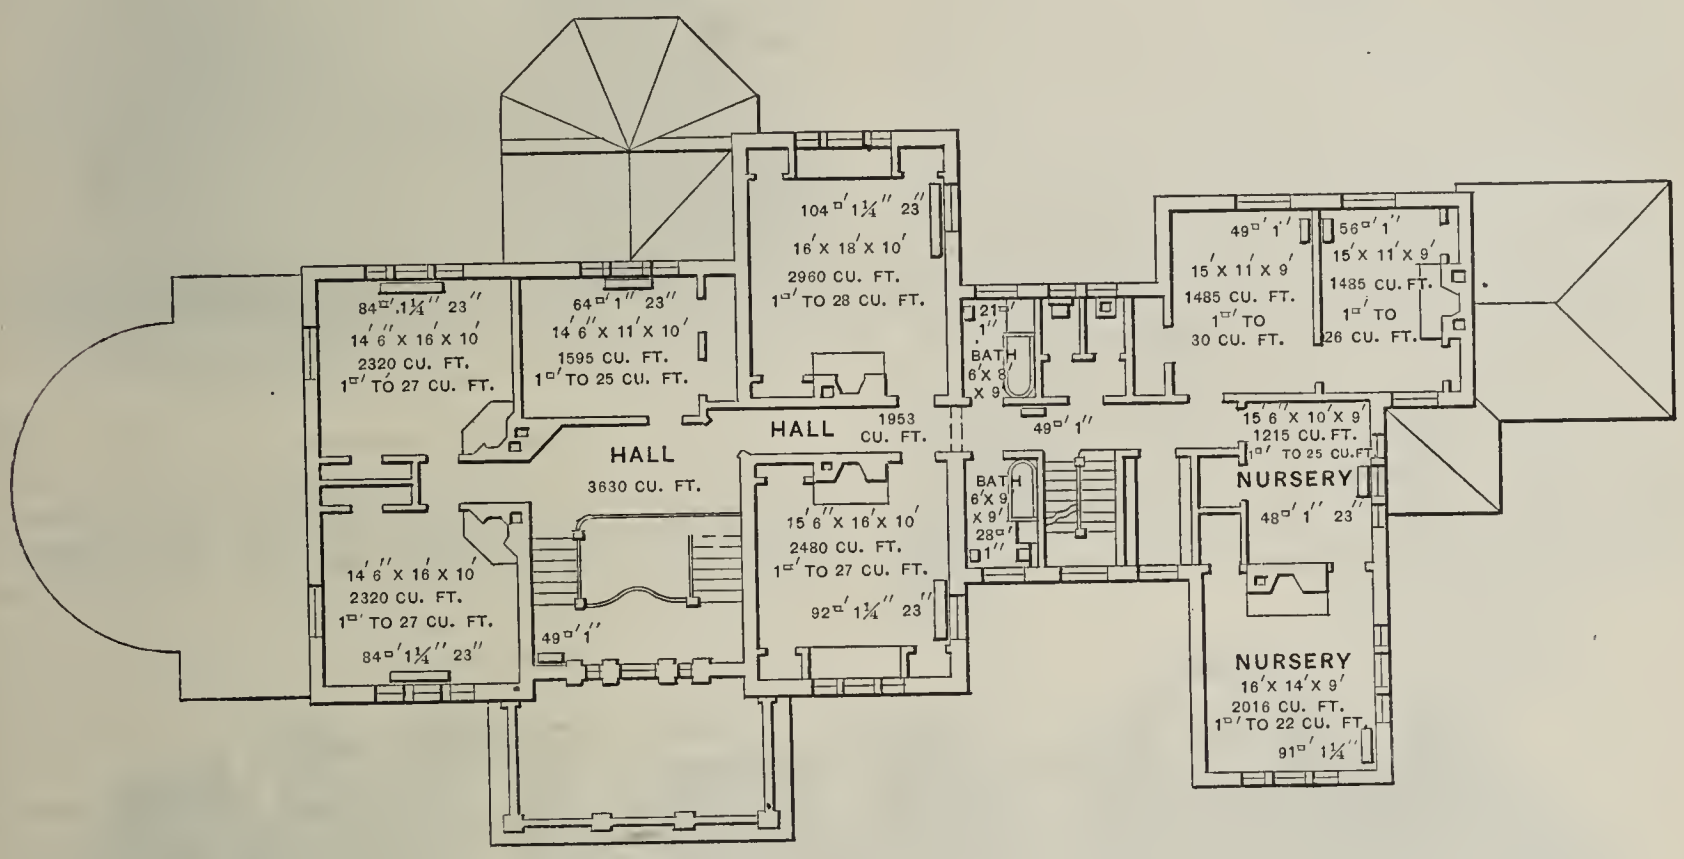

Fig 3 — Plan of Second Floor.

deemed necessary to provide ample warmth for the little folks who are to occupy this room. In addition to the space heated, shown on the plans, a room containing 2267 cubic feet of space on the third floor is heated also by a radiator, and in this room the expansion tank is placed with a pipe running to the basement, where it is connected with the return at the boiler. The expansion tank is of the closed type with a vent pipe leading out of doors so that steam or vapor may readily pass off. From the side of this vent pipe an overflow pipe is taken which leads to a place where the discharge can do no harm. Owing to the expansion tank being placed in a room that is warm it has not been deemed necessary to connect a pipe from the flow main with it to secure circulation and keep it heated.

In connecting the branches from the flow main, in the majority of cases they are taken from the top, except where the branches are connected with the main at the boiler, when they are taken from the side. The branch which supplies the heating coil in the conservatory is also taken from the side of the main which supplies it. Additional interest will be taken in this heating system and the information it may convey to the reader studying it, owing to the fact that it has now been in successful operation one season, having stood the test of last winter.

The Miller-Ware Automatic Heating Company of Buffalo, N. Y., have been incorporated, with a capital of $100,000. The directors are John L. Beveridge of Colgrove, Cal.; W. Gordon Miller of Pittsburgh, Pa.; J. Clark Williams of Buffalo; E. R. Ware of Worcester, Mass., and S. J. Douglass of East Aurora.

The National Executive Committee.

A call has been issued by President T. P. Culloton of the National Association of Master Plumbers for the mid-year meeting of the National Executive Committee, to open January 25 at the National Headquarters in the Revere House, Chicago.

The committee is composed of Wm. H. Doyle, James Meathe, C. C. Dewstoe, Ed. Braden, Jr., M. J. Ward, John L. E. Firmin, John Hickman, James Ahern, Hubert Kelly, James J. Johnson and P. M. Murphy.

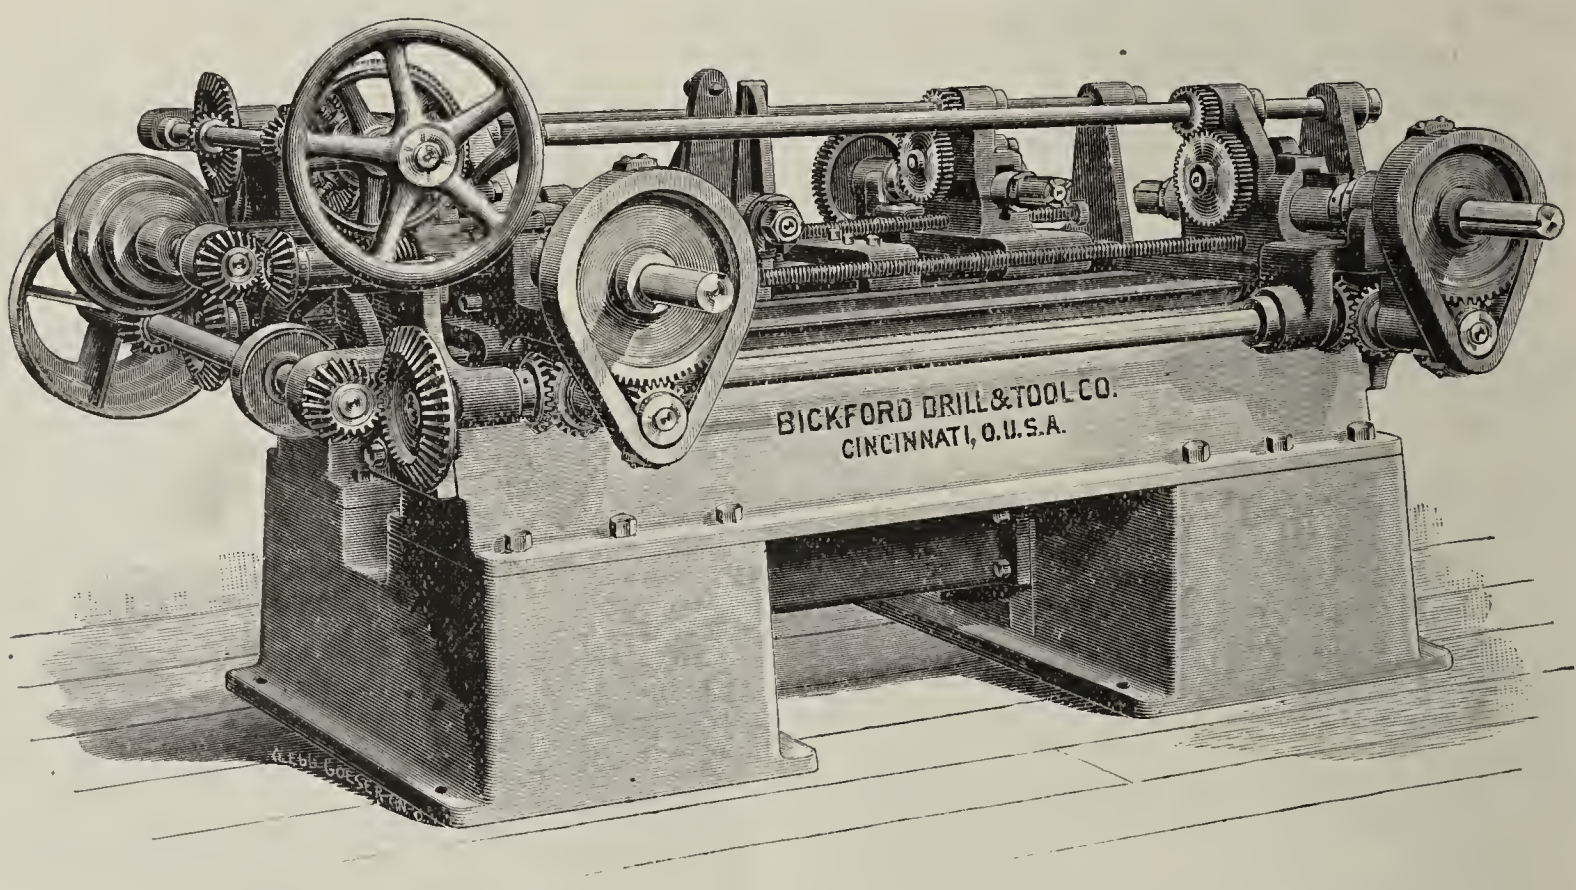
Any business requiring the attention of this committee should be promptly brought to the attention of some member of it or the president to be considered at this meeting.

Acetylene Gas Regulations.

The Board of Fire Commissioners of Jersey City, N.J., has adopted regulations for the manufacture and storage of acetylene gas. The regulations provide: "That the manufacture of carbide of calcium or the liquefaction of calcium carbide be prohibited except under certain prescribed limitations to be designated by the board. That it declines to permit the use of any acetylene gas regenerator in this city except those devices first submitted to the board for careful test, examination and approval of the board. That after the careful examination made into the methods of operation of the Bournonville gas regenerator, and finding the same to be operated on safe scientific principles, and in view of the small quantity of carbide treated by said device and the careful storage and distribution of the same, that the embargo laid by the board against the use of this machine be withdrawn and its operation sanctioned, provided that the methods now employed be not altered or made more dangerous.

"It is further provided that the use or storage of calcium carbide be confined to quantities of 5 pounds each, which must be stored in heavy block tin vessels, and until ready for use hermetically sealed, and that no dwelling, factory or other building be permitted to keep on storage a total quantity in excess of 25 pounds in cans or vessels of 5 pounds each.

"All parties desirous of storing in this city a quantity of calcium carbide or liquefied acetylene gas in excess of the limitations above defined to be allowed to do so only upon formal request to the board and special permission obtained therefrom."



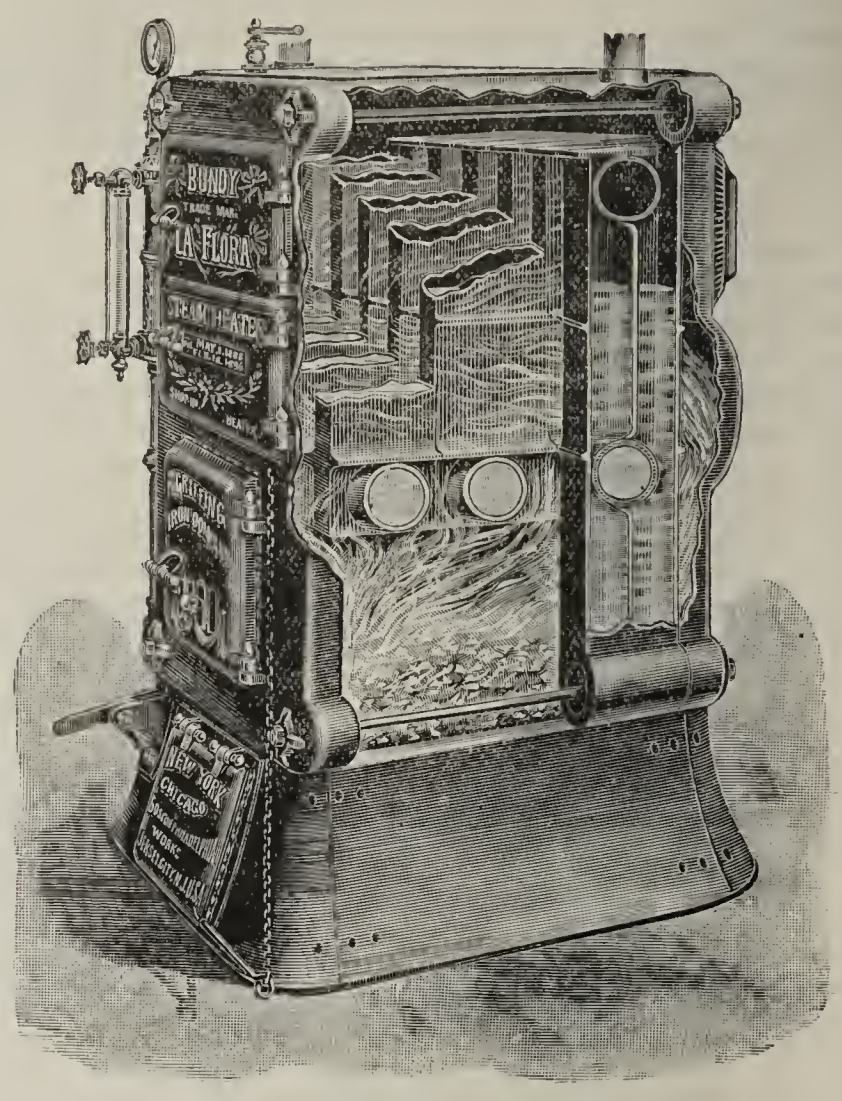
Of the 137 master plumbers who took the examination at Milwaukee, Wis., 75 passed and 58 failed. In announcing the result the Board of Commissioners gave the numbers that were on the papers of those who succeeded in passing the examination. In this way the names of those who were unsuccessful have not been disclosed to the public.

M. T. Hoey.

We regret to announce the death of M. T. Hoey, which occurred January 12. Mr. Hoey had represented the house of Thomas Hoey, 399-405 Atlantic avenue, Boston, Mass., for the past three years as traveling salesman among the towns of Eastern New England, and was well known and universally liked by all of the trade in the places he visited. His death was the indirect result of a serious operation performed the early part of October, but was immediately due to his devotion to business. He had recovered from the operation sufficiently to be about, but in a much weakened condition. Considering there were affairs in a neighboring city which needed his personal attention, and in spite of the protests of Mr. Hoey, he made the trip, thereby catching cold, which brought on pleurisy and resulted in his death.

Radiator and Boiler Drill and Boring Machine.

The accompanying cut illustrates a new four-spindle drilling and boring machine which the Bickford Drill & Tool Company, 530 East Front street, Cincinnati, Ohio, have just placed on the market. The tool is especially applicable for the drilling and boring of radiator and boiler sections, for which purpose it was designed, but its construction is such that it can be adapted to a much wider field of usefulness, and rearranged for a great many classes of work. It is entirely automatic in action and will bore four 5-inch holes through cast iron boiler sections 1½ inches thick in 2½ minutes. The bed is made in two parts, so that the work may be slid into position from the end of the machine. The hand wheel at the left furnishes a quick return movement to the spindles, all of which operate simultaneously. The heads are entirely independent of one another, and may be adjusted to any part of the bed, which is made in various lengths and is fitted with from 2 to 12 heads, according to the work for which the machine is intended. The following gives some of the dimensions of the machine as shown: Diameter of spindles, 2 7-16 inches; traverse of spindles, 6½ inches; length of machine, 9 feet 4 inches; width of machine, 7 feet 7 inches; diameter of driving cone, 18½, 15¾ and 13 inches; width of face of driving cone, 5¼ inches; minimum distance from center to center of spindles, 15 inches; maximum distance from center to center, 72 inches; weight of machine, about 8000 pounds.



Radiator and Boiler Drill and Boring Machine

Frank J. McGlade, Doylestown, Pa., has finished the plumbing system and steam heating plant in the handsome new residence of Samuel Penrose. There are two bathrooms, floored and wainscoted with tile, fitted with enameled bathtubs and silver plated fittings. The kitchen and pantry are fitted up in the modern style. A No. 3 Mercer steam boiler is connected with a heating system, which includes both direct and indirect radiation.

Bundy La Flora Heater.

The Bundy La Flora heater, manufactured by the A. A. Griffing Iron Company, 66 68 Centre street, New York,

Bundy La Flora Heater.

with branch houses at Boston, Mass., and Philadelphia, Pa., and with works at Jersey City, N. J., is of sectional construction and of the return flue type. The fire first plays upon a large amount of crown sheet surface, as may be seen by the illustration herewith, that is irregular in contour and which has a retarding influence, so that as much heat may be absorbed by this direct flame touched fire surface as possible. The hot gases are then conducted twice the entire length of the heater through flues, entering the smoke pipe at the rear. There is a water section both front and rear, and the fire in turning into the first or lower tier of flues acts directly against a water backed surface by right angle impingement. This method will commend itself strongly to practical engineers as an

economical feature of great importance. The Bundy La Flora heater is made up of a series of sections that are of the full width of the heater. These sections are shipped by the manufacturer all put together ready for assembling side by side in such numbers as the size of heater requires. The component parts of the single sections are joined together by smooth nipples, iron to iron, and are carefully tested. The sections are also put together with smooth nipples, iron to iron. Around the smooth nipples and between the bosses are placed gaskets of special construction as a secondary precaution against leaks. It is claimed that all joints will be tight on the nipple, or on the gasket, but the use of the double precaution is commendable along the line of high grade production.

The main circulation in the Bundy La Flora heater is vertical, and by virtue of the liberal sized openings in all sections extending from the lowest part directly to the highest part of the heater the steam produced in any section takes the shortest route to the steam depository at the top, where the outlet pipes are connected. This, it is pointed out, procludes frictional circulation, which causes unsteady water line. The grate is of the rocking and dumping type, non warping and with lateral fingers around the socket to quicken and keep bright the marginal fire that acts upon the vertical fire pot surface at the sides and ends. The fire door opening is large to assist in coaling, so that an even distriution of the coal is made possible over the entire surface of the fire by the fire tools furnished with the heater. The fire door is lined to prevent warping and to secure a baffle plate, which in conjunction with the slide opening permits the admission of air into the gas burner chamber with, it is said, highly satisfactory results as viewed from the standpoint of minimum fuel consumption. The Bundy La Flora heater is made only for steam, its companion heater for hot water being the Bundy La Belle heater. The La Flora is made in seven different sizes, ranging in gross capacity from 300 square feet of direct radiation to 1400 square feet. As the cut shows it has no drums or headers and is very easy to set up. The front is of attractive design, and the heater is easily cleaned.

Missouri State Association of Master Plumbers.

The Missouri State Association of Master Plumbers was organized in St. Joseph, Mo., on the 10th inst. A number of representative plumbers from different parts of the State met at the Commercial Club house and took the initial steps in the movement that is expected to result in much benefit to the entire plumbing trade. The meeting was called to order by D. J. Collins of St. Louis, who is vice-president of the National Association of Master Plumbers. M. J. Ward was elected president, and in his address accepting the office he called attention to the prosperous associations of plumbers which are flourishing in nearly every State in the Union, and expressed the hope that Missouri would soon be in line with other States in this matter.

New Haven Plumbers and State Convention.

The eighth annual convention of the Connecticut State Association of Master Plumbers will be held in New Haven on February 16, under the auspices of the New Haven Master Plumbers' Association. At a recent meeting committees for the convention were appointed, as follows:

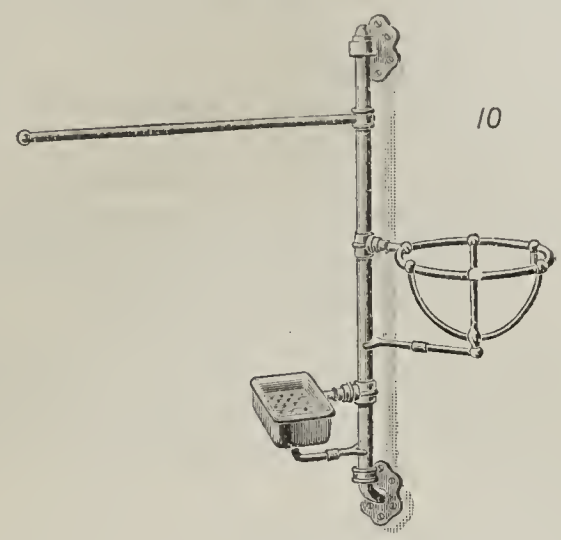
Chairman General Committee.—S. E. Dibble.

Finance.—Clinton E. Coe, chairman; T. W. Corbett, James M. English, J. Newton Pierpont.

Invitations.—Andrew J. Clerkin, chairman; W. A. T. Smith, T. L. Routh, Christian Herpich.

Printing and Badges.—William H. Hazel, chairman; A. B. Wilkinson, C. C. Bradley, Edward N. Botsford, Frank Rourke, A. H. Buckingham.

Banquet.—Theodore A. Potter, chairman; Robert Morgan, F. A. Curtiss, Robert Liddle, D. E. McNamara.



Reception.—Charles U. Neumann, chairman; William Keane, E. A. Rourke, Joseph Carr, J. E. Igo, J. A. Campbell, F. A. Carlton, W. T. Bristol, D. F. Kelly, A. B. Sproul, J. D. Eldridge, J. H Buckley, William H. McDonald, J. J. Sullivan, E. J. Ryan, L. F. Grady, T. R. Catton.

Refreshments.—D. M. Sheehan, chairman; H. H. Guernsey, J. B. Beegan, P. J. Donnelly, F. A. Campbell, A. Edmondson.

Music and Entertainment.—S. E. Dibble, George Edmondson, C. Elmer Dibble, W. M. Farrell, J. L. Clark.

Vanderman Toilet Fixtures.

The Vanderman Plumbing & Heating Company, Willimantic, Conn., who have brought out many interesting novelties, have applied for a patent for and are manufacturing the Vanderman system of toilet room fixtures and holders, illustrations of three combinations being shown herewith. The devices, it will be seen, consist of vertical rods upon which various combinations of fixtures can be fastened. It will be noted that they take up little space

The Vanderman Toilet Fixtures.—Fig. 1.—*Combination No.* 1.

are made so that they can be easily kept clean, and being adjustable on the handle either vertically or horizontally, they can be placed in the most convenient position. The brackets that hold the standard are provided with screws so that they can be readily attached or removed from the wall or wood work of any room. The numbers in the

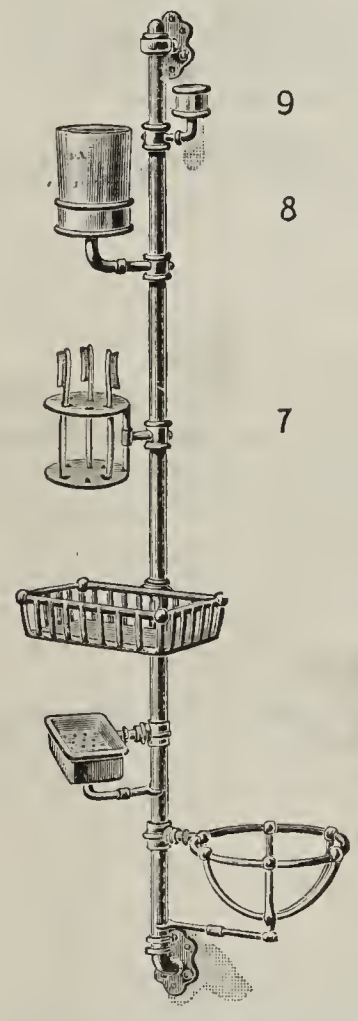


Fig 2.—*Combination No.* 2.

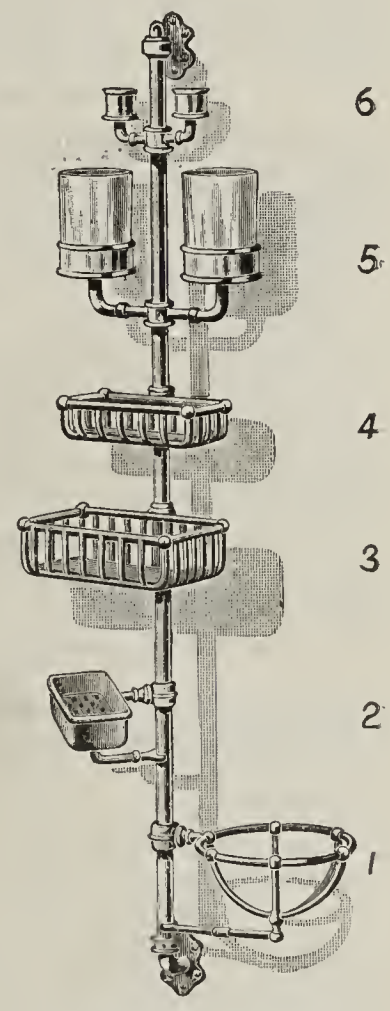

Fig 3 —*Combination No.* 3

cuts designate the different fixtures. No. 1 is a sponge holder; No. 2, soap cup; No. 3, brush holder; No. 4, comb holder; No. 5, tooth brush and tumbler holder; No. 6, match and burnt match holder; No. 7, tooth brush holder; No. 8, single tumbler holder; No. 9, match holder, and No. 10, towel holder. The fixtures are all nickel plated.

Duffey Brothers, 304 Stockton street, San Francisco, Cal., have recently completed the plumbing in the Spreckels Building in that city. They have made a specialty of fine plumbing work, and have done the plumbing in the Union Depot, the Berry Building, the Pacific Mutual Life Building, Doctor McNutt's Sanitarium, the Supreme Court Building and numerous other large and important buildings in the city. The firm make a display of handsome plumbing goods and carry a large stock.

ANNUAL MEETINGS.

NEW YORK MASTER PLUMBERS.

At the annual meeting of the Association of Master Plumbers of New York, held at their headquarters, 155 East Fifty-eighth street, January 4, the following officers were re elected to serve for the ensuing year:

President, Samuel L. Malcolm.
Vice President, Isaac J. Brown.
Recording Secretary, Andrew H. Brown.
Financial Secretary, John W. Cooney.
Treasurer, James O'Brien.
Sergeant-at Arms, Charles A. Walsh.
Marshal, William Kirchof.
Trustees, James Gilroy, John Mitchell, T. J. Cummins, Wm. Montgomery and Alexander Bryant. Wm. Lockwood will continue as the clerk of the association.

CINCINNATI MASTER PLUMBERS.

The annual meeting of the Master Plumbers' Association of Cincinnati, Ohio, was held in the Builders' Exchange, and there were two tickets in the field when the election of officers for the year was begun. The following were elected:

President, W. F. Wagner.
Vice-President, Wm. Lawson.
Secretary, W. M. Jenny.
Sergeant-at-Arms, Thomas D. Lynn.
Directors, Wm. Attlesey, Thomas J. Canary and Charles Homan. After the election of officers the delegates to the State Convention, which will be held at Dayton on February 16, 17, 18, were chosen, as follows: Delegates as officers of State Association, Wm. Attlesey and Ed. J. Nolan. As delegates, Wm. F. Wagner, Louis Krouse, Wm. H. Botley and Arthur McPhee. As alternates, Chas. Homan, George Stocker and A. J. Diehm

BINGHAMTON MASTER PLUMBERS.

At the annual meeting of the Master Plumbers' Association of Binghamton, N. Y., the following officers were elected for the ensuing year:

President, L. A. Galpin.
Vice-President, D. J. Malane.
Secretary, G. Cropper.
Treasurer, W. D. McCullaugh.

The association has appointed committees to arrange for the tenth annual convention of the New York State Association of Master Plumbers, to be held in Binghamton on March 1 and 2. The Committee on Halls consists of W. D. Scoville, T. A. Warner, J. S. Oftering and G. Cropper. The Committee on Hotels is made up of D. J. Malane, L. A. Galpin and G. Cropper.

INDIANAPOLIS MASTER PLUMBERS.

At the annual meeting of the Master Plumbers' Association of Indianapolis, Ind., held January 3 in the Builders' Exchange, the following officers were elected for the ensuing year:.

President, James M. Healy.
Vice-President, W. W. Wilcox.
Treasurer, George Kirkhoff.
Recording Secretary, Wm. Keopper.
Financial Secretary, Joseph Haslinger.

After the election the members discussed the new ordinance, which carries with it the appointment of a plumbing inspector with a salary of $1200 per year, who must stand an examination.

THE CHATTANOOGA MASTER PLUMBERS.

From Secretary Fred. Fox, Jr., we learn that at the annual meeting of the Chattanooga Master Plumbers' Association, held January 3, the following officers were re-elected to serve for the ensuing year:

President, R. O. Carlin.
Treasurer, H. A. McQuade.
Secretary, Fred. Fox, Jr.

The local organization is said to be perfect and all the supply houses in the vicinity of Chattanooga have not only signed the Baltimore resolutions but are living up to them.

HUDSON COUNTY, N. J., MASTER PLUMBERS.

The Master Plumbers' Association of Hudson County, N. J., at their annual meeting, Thursday evening, January 6, held at Groeschell Hall, Jersey City, elected the following officers for the ensuing year:

President, J. A. McDonald.
First Vice-President, T. H. Heatherton.
Second Vice-President, J. Donnelan.
Third Vice-President, T. Doran.
Recording Secretary, M. P. Moran.
Financial Secretary, J. A. Sprouls.
Corresponding Secretary, N. Waltherthum.
Treasurer, W. J. Cross.
Sergeant-at-Arms, J. Anderson.
Trustees: F. T. Kelleher, Thomas Cox and B. Keilt.

DETROIT MASTER PLUMBERS.

At the annual meeting of the Master Plumbers' Association of Detroit, Mich., held January 8, in the Builders' Exchange, the following officers were elected:

President, Samuel Dickson.
Vice-President, J. E. Lee.
Recording Secretary, S. H. Morgan.
Financial Secretary, John G. Kraemer.
Treasurer, Richard Walsh.

Delegates to the Convention of the Michigan State Association of Master Plumbers, to be held at Lansing in February: Guy Greeney, Samuel Graham, J. E. Lee, P. Steiner, Richard Walsh, Thomas Norris, James Cameron, Jr., S. H. Morgan, O. Helm, C. Childs, Samuel Dickson, James Meathe, James Crumley and James Partlan.

BROOKLYN MASTER PLUMBERS.

At the annual meeting of the Master Plumbers' Association of Brooklyn, N. Y., the following officers were elected for the ensuing year:

President, Thomas Kelly.
Vice President, Fred Schlüchtner.
Treasurer, Geo. W. Smyth.
Recording Secretary, D. Donegan.
Financial Secretary, J. W. Kelly.
Sergeant-at Arms, Walter Coyne.
Marshal, John Ebel.
Trustees: E. McDonald, H. Noble and M. F. Gleason.

New York Master Plumbers' Reception.

The ninth annual entertainment and reception of the Association of Master Plumbers of New York City was held on Thursday night at the Central Opera House, 306 East Sixty-seventh street, New York, and was a highly successful affair. A feature was the attendance of master plumbers from other cities. New Jersey was represented by National State Vice-President W. Zeliff of Newark, and Brooklyn, N. Y., by the new officers, Thomas Kelly, Fred. Schlüchtner, G. W. Smyth, D. Donegan, J. W. Kelly, Walter Coyne, John Ebel, Eugene Kelly, M. F. Gleason and E. McDonald.

Among those present from New York were: Samuel L. Malcolm, John Byrns, E. Burns, Alexander Bryant, H. J. Pattison, T. J. Tuomey, I. J. Brown, Wm. Kirchoff, A. H. Brown, B. F. Donahoe, George Brown, C. H. Kranichfelt, Wm. Brown, T. J. Cummins, T. J. McCormack, Wm. McCormack, J. W. O'Brien, John Yule, Charles Walsh, John Renehan, E. Mueller, Wm. Seelig, T. Clark, J. Muir, R. Donahoe, E. Collins, J. J. Flood, E. J. Brady, John Carey, James Tennant of the Health Department, and Wm. Lockwood, the clerk of the association.

The committee who provided the entertainment was T. J. Tuomey, J. W. O'Brien, J. W. Cooney, T. J. McCormack, B. F. Donahoe, T. F. Gaynor, A. H. Brown and H. J. Pattison. The hall was handsomely decorated with evergreens and palms. The evening opened with music by the orchestra and a fine variety entertainment, ending with an exhibition of views by the cinematographe. At the close of the entertainment the handsome costumes gave a coloring to the gathering, and after the grand march an elaborate programme of dances was begun.

The Entertainment Committee received many assurances that their efforts to please had been most successful.

Water Waste and Spring Faucets.

The Chicago authorities are determined to check the great waste of water known to be made in that city. An ordinance before the City Council provides that "any plumber who shall put in place any other than a spring faucet on any wash hand basin, sink or similar water fixture after the passage of this ordinance shall, as a penalty, be subject to having his license revoked at the discretion of the Commissioner of Public Works." It is further expected that after a certain time a regulation will be enforced requiring all ordinary faucets now in use to be replaced by spring or self closing faucets. The claim is made that many householders open their faucets in hot weather and let the water run for hours in the belief that they are thus cooling the atmosphere of their houses, and in extremely cold weather they do the same thing to prevent the water pipes from freezing.

Bargains in Plumbers' Supplies.

Two plumbing supply houses of the borough of Brooklyn, Greater New York, are amusing the trade and demoralizing prices by issuing from day to day bargain lists of plumbing goods at cut rates. Such a course is widely at variance with the efforts now being made by the wholesale houses and the plumbers to arrange for conferences to remedy the evils of the trade and settle their differences.

NOTES.

John Hunter, a well-known brass founder of Halifax, N. S., died recently at his residence on Birmingham street, at the age of 78 years.

Geo. Z. Winter, Southbridge, Mass., has just finished putting a Gurney Steam Boiler in the residence of John A. McKinstry. He has also contracts for installing Gurney Steam Boilers in the residences of Peter Peck and John M. Clemence.

The business of the Sanitary Company, Portland, Maine, has been purchased by E. P. Sargent, Jr.

Harry Dayton has purchased a hardware store at Burton, Ohio, and will move his stove and tin business from Orwell.

The Board of Health of Salem, Mass., for 1898 has organized with David M. Little, chairman. There being a vacancy in the Board of Examiners of Plumbing, Chairman Little will represent the board, thus making the Board of Examiners of Plumbing for 1898 consist of Alderman David M. Little, Inspector of Buildings John Pollock and Inspector of Plumbing L. E. Millea.

The Wolfe Warming & Ventilating Company, Boston, Mass., have the contract for warming and ventilating the new school at Auburn, Maine, and J. H. Chase has the plumbing contract.

The Board of Aldermen of Kansas City, Mo., have passed an ordinance to charge plumbers $1 for every permit issued and creating the offices of deputy plumbing inspector and plumbing inspector's clerk.

At a meeting of the Examining and Supervising Board of Plumbers and Plumbing, held in its room in the Municipal Building, Buffalo, N. Y., Tuesday, January 4. Charles B. Huck was unanimously chosen for chairman for the ensuing year. This is the third time his associates upon the board have chosen him for their presiding officer. Joseph Irr was elected to fill the position of secretary and treasurer, filled for the past three years by Samuel Wright. Dean Wilson was chosen as sergeant-at-arms, a new office created this year on account of the increase of business. G. W. Ratcliffe was appointed as clerk to the board.

J. J. Giseke has been appointed a member of the Board of Examining Plumbers of Cincinnati, Ohio.

The Board of Health of Bradford, Pa., has elected Dr. F. W. Winger president, and will ask the City Council to provide an inspector of plumbing.

The Adams Steam Heating & Supply Company, Helena, Mont., have been the largest contractors in their line employed in the construction of Fort Harrison, and now have contracts at the post, Townsend, Missoula and Boulder. The concern have put in most of the steam heating plants and general plumbing in the new buildings of the several State educational institutions.

A health ordinance has been passed at South Norwalk, Conn., requiring plumbers to register, to file plans of their work and to take out permits. It provides for an inspection of all plumbing work and for furnishing the house owner a certificate of the character of the work. It also provides for trap ventilation and a number of necessary precautions of a sanitary nature.

The J. A. Fitzel Company succeed A. J. Hicks at Morgantown, W. Va., and will do a heating, plumbing and roofing business, besides carrying a line of Stoves, Tinware and House Furnishing Goods. J. A. Fitzel of the new company was formerly in the employ of McClure & Co., Pittsburgh, Pa.

John I. Leitch of the New York office of the Standard Radiator Mfg. Company of Buffalo, N. Y., informs us that the arrangement existing between the Standard Radiator Mfg. Company of Buffalo and the St. Louis Radiator Mfg. Company of St. Louis, Mo., has been canceled, and that in future the Standard Radiator Mfg. Company of Buffalo will do business with the trade direct, and that they are the exclusive proprietors of the Standard radiation. It is also pointed out that the location of the plant in Buffalo, the "Electric City," for manufacturing and shipping is unrivaled. The capacity of the plant is said to be between 4,000,000 and 5,000,000 square feet of radiation, which is warranted in every respect for style, workmanship, price and prompt shipment. A new catalogue is soon to be issued giving full particulars in reference to their line.

J. D. Stewart, South Fork, Pa., has arranged with Prof. Paul M. Dysart of Pittsburgh, Pa., to manufacture the Acetylene Gas Regenerator invented by him. Mr. Stewart has installed lighting systems in the Baker and Crouse hotels, in the residences of Dr. J. H. Glass, W. L. Stineman, A. M. Stineman, and in his own store and workshop.

L. Emler has been granted a license as a plumber at Boulder, Col.

Elisha A. Loring has been appointed the Inspector of Buildings and Plumbing at Everett, Mass.

The firm of Bennett & Hammer, at Great Barrington, Mass., have been dissolved, and the plumbing and heating business will be conducted in the future by John Hammer under the firm name of Hammer Brothers.

The establishment of the Lucey Plumbing Company, North Adams, Mass., was recently visited by fire.

Frank McLain, who has been spending the holidays at Canton, Ohio, has returned to the New York office of the J. H. McLain Company, at 83 Centre street, and is prepared to push their line of Steam and Hot Water Heaters with renewed vigor.

A. T. Henderson of the New York office of the United States Heater Company is making a visit in Detroit.

Fred. D. Johnson of Fred. D. Johnson & Co., 83 Centre street, New York, spent the early part of the week at Buffalo visiting the International Radiator Mfg. Company.

Secretary Henry B. Gombers of the National Association of Master Steam and Hot Water Fitters states that 42 new members have been taken into the association since the last convention, and the list in accord has also shown a gratifying increase in number.

A new ordinance at Buffalo, N. Y., provides that only licensed plumbers will be allowed by the Bureau of Water to connect with the water service.

The manufacturers of brass goods will hold their quarterly meeting at Buffalo February 12. A feature of the meeting will be an effort to secure a different classification from freight carriers on the products of brass foundries.

The Examining and Supervising Board of Plumbers of Poughkeepsie, N. Y., organized on January 8 in the office of the Inspector of Plumbing, Owen Cook. Peter Adriance was elected president and Elmer E. Easthead secretary.

Frank Uhler and Jules Zimmerman of the Henry McShane Mfg. Company, Baltimore, Md., were in New York this week, and were at the entertainment of the New York Master Plumbers Thursday night.

Henry S. Downe, who is manager of the London branch of the American Radiator Company, is now in Chicago, consulting with President Bond and other officials on the future policy of the company relative to foreign trade. After a long period of persistent work, and patient application to the removal of various impediments, encouraging results are being shown. Mr. Downe will return to his post about February 1.

At a meeting of the Board of Plumbing Examiners of Hudson, N. Y., J. Frank Kertz was elected president and James H. Pultz was elected secretary. Those present at the meeting were J. Frank Kertz, Byron Parker, C. A. Parker, John Fuller and John P. Ganley.

The Toledo Master Plumbers' Association will send to the convention of the Ohio State Association of Master

Plumbers, to be held at Dayton on February 16, 17 and 18, eight delegates. They are State President W. G. Wacker, State Secretary Ed. Gruber, State Executive Committeeman Robert Raitz and five delegates from the local association, John Schultz, Thos. Manion, Wm. Gerken, J. C. Meissner and Harry Teal.

Brown & Ward, Oneonta, N. Y., have secured a $2000 contract for plumbing the State Armory at that place.

Walter A. Delory, Swampscott, Mass., is having a new building erected for his plumbing business.

A. Weiskittel & Son, Baltimore, Md., will soon commence the erection of a new foundry at Bayview, about a mile from their present location in Baltimore. The new building will be 150 feet wide by 500 feet long, and will be used principally for the manufacture of iron Bathtubs. They have for some time been making Bathtubs in their stove foundry, but feeling the want of larger quarters they decided upon building a structure of a size commensurate with the necessities of the business. They are supplying the Tubs both painted and enameled, and their productions are well spoken of among the trade.

The Vanderman Plumbing & Heating Company of Willimantic, Conn., have contracted to put in the hot water heating apparatus in the new Walden Apartment Building at Hartford.

E. J. Winslow & Co., Bennington, Vt., have been awarded the contract for putting the steam heat and plumbing in the new passenger station of the Bennington & Rutland Road. The cost will be $1000.

McClellan Universal Brace.

The S. McClellan Universal Brace Company, for whom John H. Graham & Co., 113 Chambers street, New York, are manufacturers' agents, are introducing the McClellan

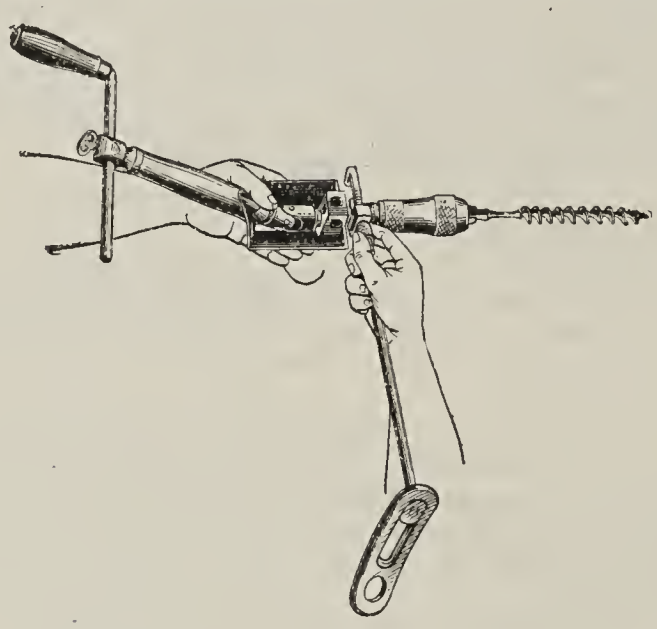

Fig. 1.—Assembling Breast Rest in One of Five Positions.

guide frame combination angle and breast brace shown in the accompanying engravings. This brace is designed to operate where it would be difficult or impossible to bore with other tools, being especially valuable, we are told, in telephone, telegraph and general electrical construction, and for car building, plumbing and carpenter work, and particularly useful for corner boring. The point is made by the company that holes can be bored in an exceedingly close space, absolutely in line with point of rest of the angle, and without wobbling. The various parts can be readily taken apart and put together. The breast rest is detachable, Fig. 1 showing it about to be attached

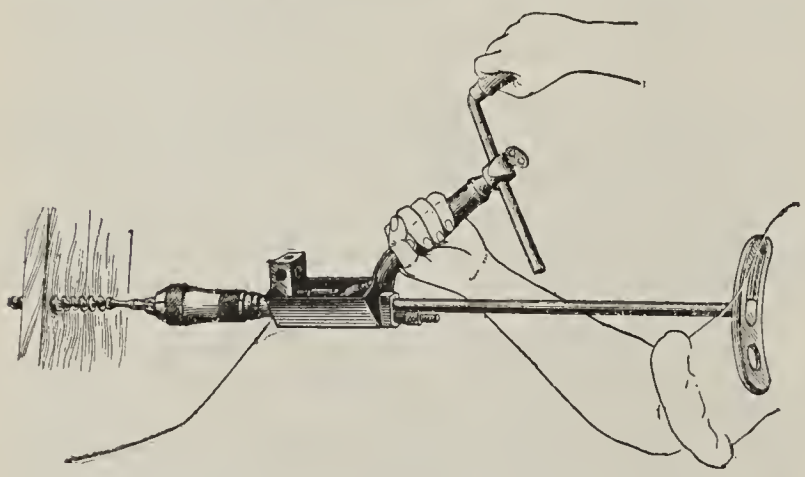

Fig. 2.—Method of Using as an Ordinary Breast Brace.

to one of the four holes at the base of the chuck. Fig. 2 shows another position for attaching the breast rest, in line with the bit instead of at right angles. The arm piece of breast rest can be moved and held rigidly from center to edge as desired. The handle can be adjusted to have a sweep of from 4 to 13 inches by moving the bar, which is held by a thumb screw. The center section

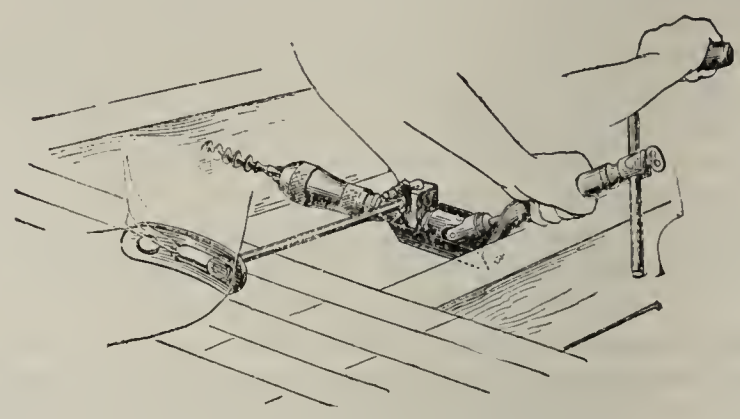

Fig 3.—Boring Between Joists in Floor.

holding the ball and socket joint is of cast metal, with two flat sides underneath, at right angles with each other, valuable as a rest in close corner boring. The handle is hardwood and the tool can be furnished in nickel plate or japan finish. Fig. 1 indicates how the breast rest is placed in one of the several positions possible. Fig. 2 shows the tool used as an ordinary breast brace. Fig. 3 illustrates the method available for boring between joists in the floor. Fig. 4 represents the brace

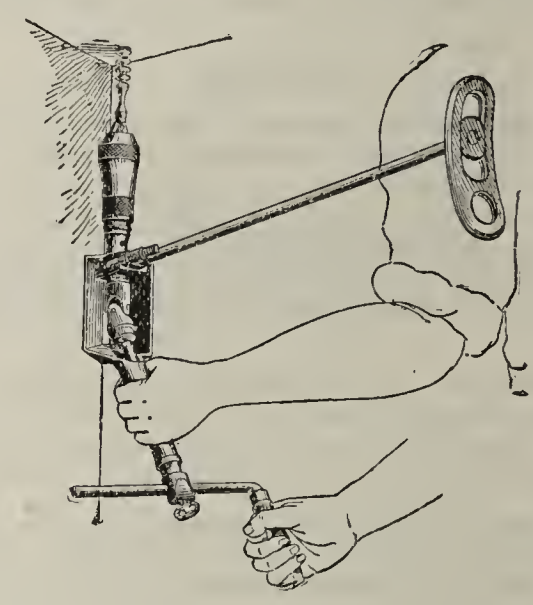

Fig. 4.—Boring Overhead, in Corner, or Between Upper Ceiling Joists.

used overhead, in corner, or between upper ceiling joists. Fig. 5 illustrates a modification of the brace described above, made for such work as is usually done by bellhangers, electricians, telephone and pattern makers, and for light carriage work. It will bore a hole up to ½ inch in any corner against the ceiling, between joists, under floor, in counters, or any place where a ratchet brace is

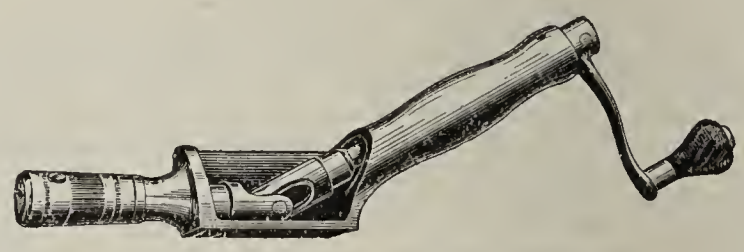

Fig. 5.—Small McClellan Universal Brace.

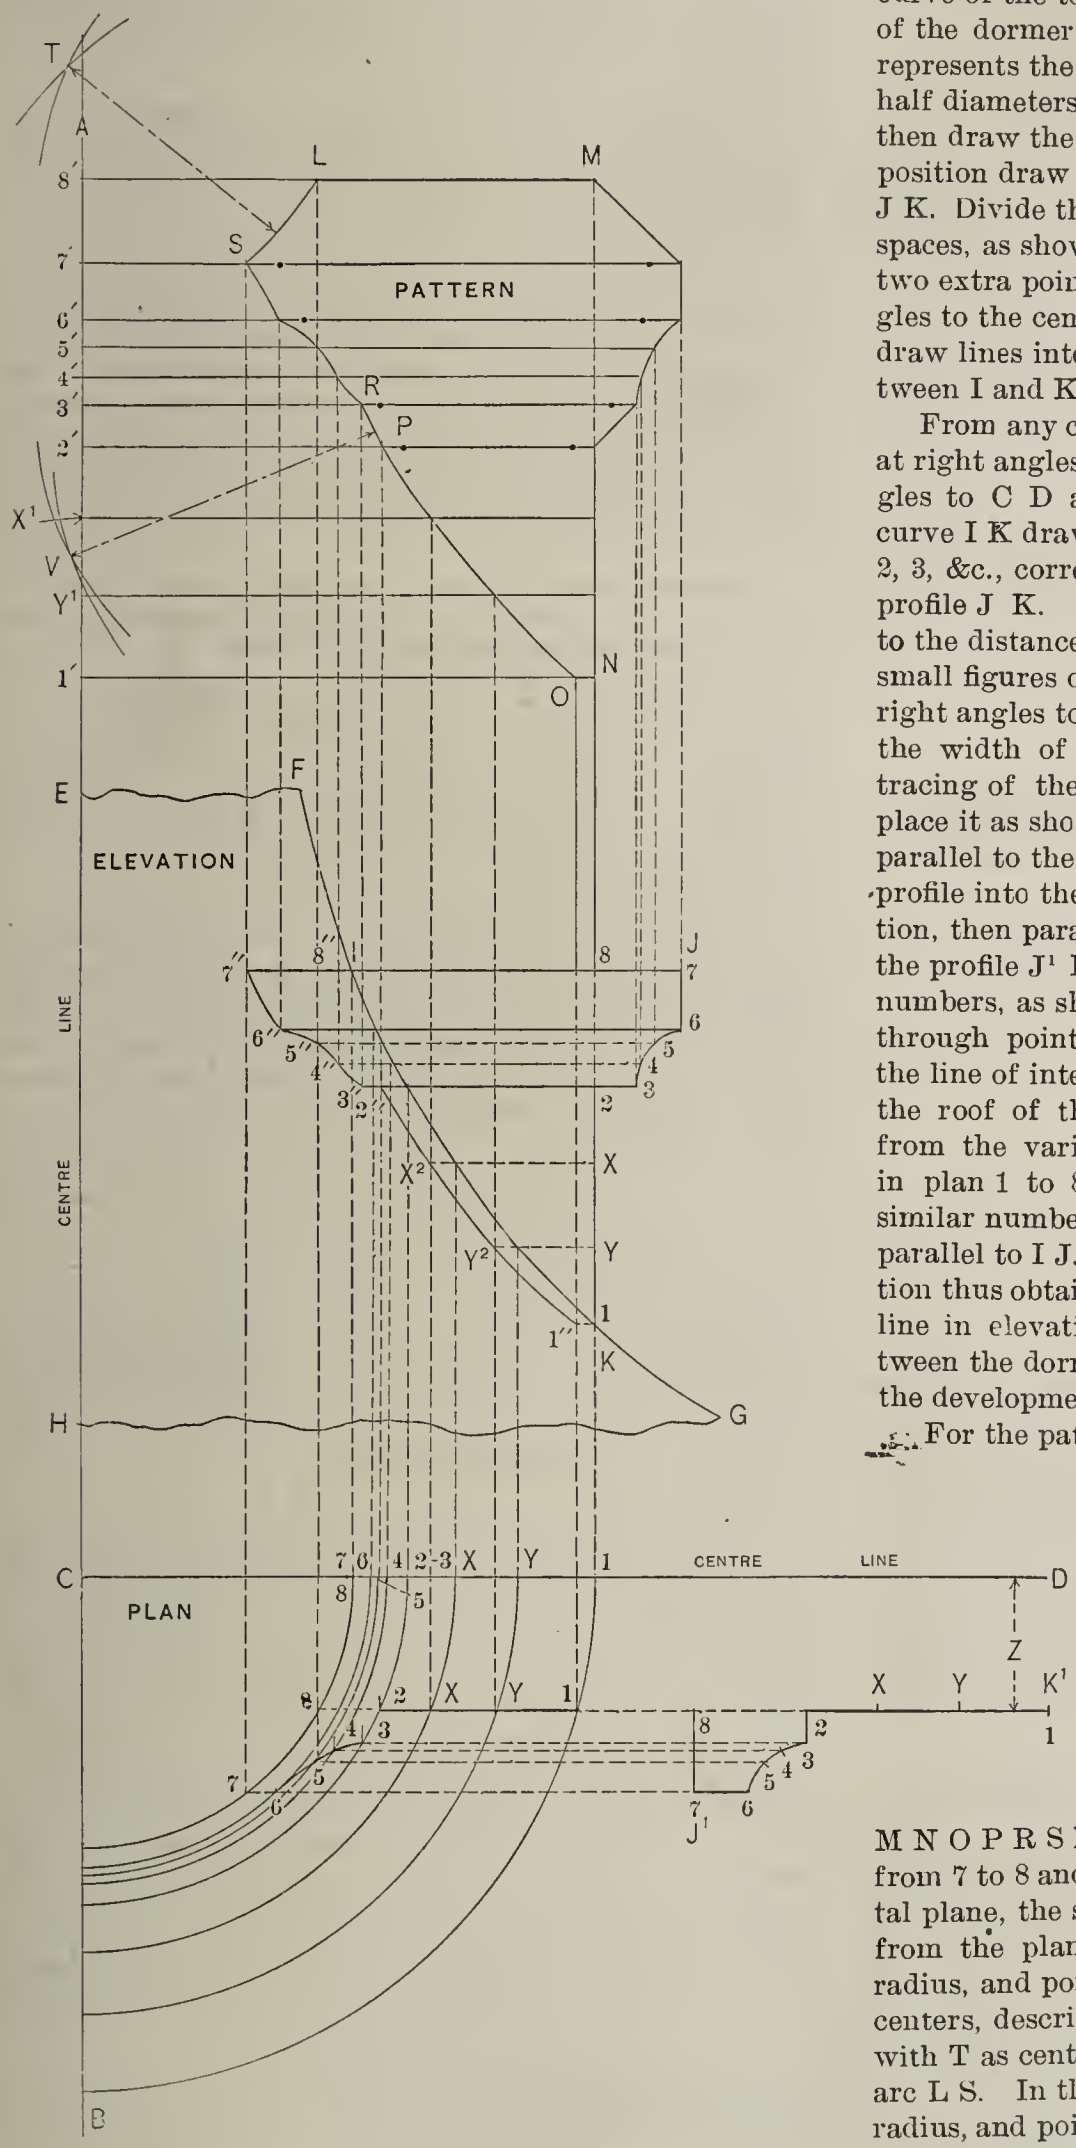


required. It is light, can be carried in the coat pocket, and is sold for much less than the brace described above.

A company under the title of the St. Petersburg Company for the Transmission of Power from Waterfalls have recently been organized at St. Petersburg, Russia, to put down plants for the utilization of the Narowa, Imatra and Wuozen waterfalls in the generation of electrical power, and to transmit to and distribute the same in St. Petersburg and surrounding districts for electric lighting and power purposes. The capital of the company is said to be $2,000,000. The purchases of both machinery and supplies will begin early in April.

SHEET METAL WORK.

PATTERN FOR MOLDINGS MITERING AGAINST CONCAVE CONICAL TOWER.

A subscriber in *The Metal Worker* asks us to tell him how to cut the pattern for the moldings on the sides of a

Pattern for Moldings Mitering Against Concave Conical Tower.

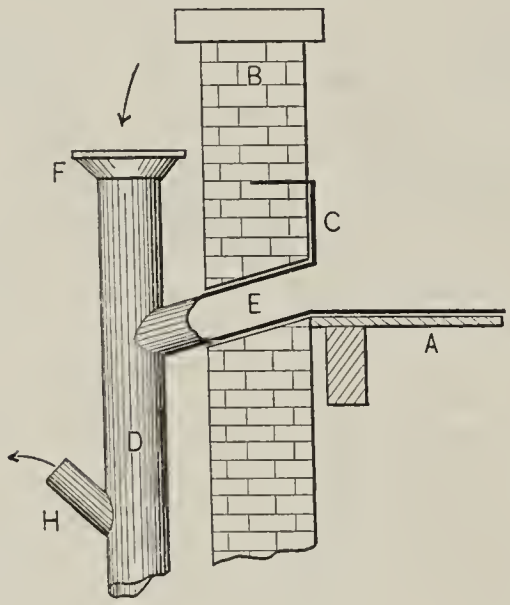
dormer window mitering against a concave conical tower, shown in the accompanying illustration, in which E F G H represents a partial elevation of the tower, and I J K the side of the dormer window which is to miter against the tower. In this connection it may be proper to remark that it is not necessary when obtaining the pattern to draw a full elevation of the tower ; all that is required being the center line of the tower and as much of the curve of the tower as will be necessary to receive the side of the dormer. Draw any vertical line, as A B, which represents the center line, let E F and H G represent the half diameters of the tower at these points respectively, then draw the desired curve or sweep F G. In its proper position draw the profile or side of dormer indicated by J K. Divide the curved portion of the profile into equal spaces, as shown by the small figures 1 to 8, introducing two extra points, X and Y, as shown. Now at right angles to the center line A B and through the various points draw lines intersecting the curve of the tower F G between I and K.

From any convenient point, as C on the center line, and at right angles to A B, draw the line C D. At right angles to C D and from the various intersections on the curve I K draw lines intersecting C D at points 1, Y, X, 2, 3, &c., corresponding to lines of similar numbers in the profile J K. Now with C as center, and with radii equal to the distances from C to the various points shown by the small figures on the line C D, draw arcs as shown. At right angles to the center line C D in plan set off half the width of the dormer window, as at Z. Now take a tracing of the side of the dormer J K in elevation and place it as shown by J^1 K^1 in plan, placing the line 1 2 parallel to the center line in plan, as shown. Space the profile into the same number of parts as shown in elevation, then parallel to C D and from the various points in the profile J^1 K^1 draw lines intersecting arcs of similar numbers, as shown by points 1 to 8 in plan. A line traced through points of intersections thus obtained will show the line of intersection between the side of the dormer and the roof of the tower. Now at right angles to C D and from the various points of intersection in the miter line in plan 1 to 8 draw lines upward intersecting lines of similar numbers in elevation drawn from the profile J K parallel to I J. A line traced through points of intersection thus obtained, as shown from 1′ to 8′, will be the miter line in elevation, showing the joint or intersection between the dormer side and tower, but is not necessary in the development of the pattern.

For the pattern proceed as follows : Upon the center line A B place the stretchout of the molding 8 J K, as shown by the small figures on A B. At right angles to A B and through the small figures draw lines intersecting those of similar numbers drawn from the miter line in plan or elevation parallel to A B, also from the various points in the profile J K in elevation. Trace lines through points of intersections thus obtained; then will M N O P R S L be the pattern required. As the distances from 7 to 8 and 2 to 3 in profile in elevation lie in a horizontal plane, the shape of that part in the pattern is obtained from the plan, as follows : With C 7 or C 8 in plan as radius, and points S and L on lines 7′ and 8′ in pattern as centers, describe arcs intersecting each other at T. Then with T as center, and using the same radius, describe the arc L S. In the same manner, with C 2 or C 3 in plan as radius, and points R and P on the lines 2′ and 3′ in pattern as centers, describe arcs intersecting each other at V ; then with V as center, using the same radius, describe the arc R P.

The completion of the Spreckels Building, at San Francisco, Cal., has called forth considerable admiration for

the work of the California Artistic Metal & Wire Company, who furnished the iron grills around the elevators, which are said to be excellent examples of old German wrought iron work. All the iron window frames, metal doors, stairways and metal work in the building were supplied by this firm, who also furnished the ceilings.



National Iron Roofing Manufacturers' Association.

The annual meeting of the National Iron Roofing Manufacturers' Association will be held in Cincinnati, Ohio, Wednesday, January 19, at the Grand Hotel. We understand from Secretary George M. Verity that, judging from the responses received, there will be a very large attendance.

Thawing Frozen Leaders.

BY W. N.

A difficulty often experienced in the winter is keeping the leaders clear of ice. Where the gutter is connected direct to the leaders it is an easy matter to clear the ice in the pipes by means of rock salt and hot water, but where a tube passes through the wall or other parts of a building and an elbow is the result, it can be accomplished as follows: Referring to the accompanying sketch, let A represent the roof, B the parapet wall and C the flashing connecting with the tube E, thence to the leader D. The pipe extends upward to allow it to be easily reached from over the wall and has a flaring collar, as shown at F. A small offshoot, H, can, if desired, be placed

Thawing Frozen Leaders

at every window having access to the leader. Assuming that the leader has been frozen, rock salt is placed at the tube E and into the pipe at F, while if convenient hot water is also poured into it, which will gradually work its way through. By having the offshoot H at every window, if so situated, hot water and salt can also be placed in them. Should, however, the ice melt on the roof and the water flow into the tube E when the pipe is not open all the way down the water can overflow at H, and will not back up on the roof nor flow under the flashing C.

The Peck, Stow & Wilcox Company,

Southington, Conn., and New York City, have just issued what they call the centennial edition of their catalogue of tinsmiths' tools and machines. They explain the name of the catalogue by saying that nearly 100 years ago such articles were first made for general use, and the Peck, Stow & Wilcox Company succeed the various individuals and firms who as pioneers laid the foundation of their present extensive business. The volume contains 144 pages and most of the pages contain several illustrations of different tools. The first goods noted are folding machines, then come grooving machines, wiring, setting down, burring and turning machines in various styles. Beading machines follow, then double seaming machines, wire straighteners and wire feed and cutters. In this connection they call attention to the wire reel which they are now offering to the trade, this being so made that it can be used in a vertical or horizontal position and the arms adjusted to any length, so that it can receive ordinary coils of wire or smaller coils if desired. Forming machines of various types follow; then corrugating machines, tube formers, folding machines and gutter machines. Squaring shears occupy nearly 20 pages, while rotary shears are likewise illustrated in various styles. Hand tools come next, and a full assortment of tinners' stakes, swedges and hammers, roofing tongs and cornice brakes are next shown. At the end are lists of machine parts and miscellaneous tinners' tools.

FLASHINGS.

The Globe Ventilator Company, Troy, N. Y., report a constantly increasing business, and refer to several large orders recently booked, among them being three 40-inch copper ventilators for the Henry McCaddin Memorial Building in Brooklyn and two 60-inch ventilators for the High School at Tarrytown, N. Y.

We are indebted to the Ornamental Stamping Works, Grand Rapids, Mich., for a copy of their elaborate catalogue of Architectural Sheet Metal Work, Ornaments, Statuary, Steel Ceilings and Spun Goods. The volume, of oblong shape, measures 12 x 9 inches and is bound in colored paper with front and back covers decorated in gilt. The firm of H. Leonard & Sons have taken an interest in this business, and the factory is now well prepared to fill orders promptly, and they call special attention to their facilities for the execution of special designs. The volume opens with Ornaments of endless variety, covering over 40 pages. Then various Capitals are shown, followed by Moldings, Friezing, Belts, &c. The next department is Sheet Metal Statuary, which includes a variety of figures. The rest of the book is given up to Ornaments and Ceiling Designs, Rosettes, &c.

The Birmingham Paint & Roofing Company, Birmingham, Ala., are putting up a large plant for the manufacture of Iron Roofing materials of all kinds.

The Chamberlain Metal Weather Strip Company of Detroit, Mich., have been incorporated, with a capital of $5000, by Charles Breden, Hugh E. Kenney and others.

John W. Burry, president of the Cambridge Iron & Steel Company, Cambridge, Ohio, with E. E. Winckler of 136 Liberty street, New York, recently paid a visit to the trade in Philadelphia.

William Connors, 669-675 River street, proprietor of the Troy Paint & Color Works, Troy, N. Y., is favoring his friends in the trade with a very pretty calendar for the new year in the shape of a poster lithographed in colors. The upper half of the poster carries a *fac simile* of the trade-mark of American Seal Paint, the general design being national in character, as it shows Uncle Sam and Miss Columbia in the foreground, with a view of the Capitol at Washington in the distance. There are also various cans of Ready Mixed Paints, Varnish, Roofing Cement, Mortar Color, &c., scattered about the foreground, and as Uncle Sam holds a pallette and brushes in his hand it is evident he has been demonstrating the practical merits of some of the goods advertised. The leaves carrying the calendar proper are of a light greenish hue, the printing being in bold faced white letters and figures. Underneath the leaves is a list of the varied lines of Paints and Cements which Mr. Connors is prepared to furnish. He states that samples and prices will be sent free on application.

The Iron City Mfg. Company, successors to A. Northrop & Co, and which, as noted in our last issue, was purchased by John C. Graff of the Graff Roofing Company of Pittsburgh, Pa., who will reorganize the business under the name of the Iron City Mfg. Company, Mr Graff being president, send us a copy of their Catalogue G. This is a pamphlet of 52 pages giving full information about the Sheet Metal Ceilings, Roofings, Siding and Moldings, both plain and ornamental, made by the above concern. The earlier pages present illustrations of Friezes, Borders, Coves, &c., these being followed by panel designs and coverings, sectional and detail illustrations showing the method of applying the metal. An interesting part of the pamphlet is taken up with illustrations of various ceiling designs, showing many handsome combinations that can be made with the different styles and their application to all sorts of buildings. As an indication of the popularity of the work done by this concern it may be mentioned that the list of references alone covers six closely printed pages, these being exclusive of the testimonial letters. At the close are given instructions for putting on Northrop Patent Sheet Iron Roofing.

The firm of Mager, Ritter & Co., doing business in Stoves, Tinware and Cornice Work at 113 South Seventh street, Allentown, Pa., were recently dissolved by mutual consent, Thomas E. Ritter retiring. The business will be conducted by Daniel Mager under the name of the Allentown Cornice Works.

TIN PLATES.

GOVERNMENT REPORT OF TIN PLATE PRODUCTION.

Col. Ira Ayer, Special Agent of the Treasury Department, has completed his annual report on the production of tin and terne plates in the United States covering the fiscal year ended June 30, 1897. This report is the last that will be issued under Government auspices, as it completes the six years of probation marked out for the American tin plate industry under the terms of the McKinley act. It shows a remarkable advance in the production of American tin plate over the previous fiscal year, amounting to over 45 per cent., while the net imports of foreign plates fell off in the same period about 60 per cent. Colonel Ayer's report is in part as follows :

During the fiscal year ended June 30, 1897, the production in the United States of commercial tin and terne plates was 446,982,063 pounds, against 307,226,621 pounds produced during the previous fiscal year, showing thereby an increased production of more than 45 per cent. Of the production for the year, 446,924,855 pounds, or practically the entire output, was made from sheets rolled in the United States.

The production for the year, distributed according to kind and weight of plates, was as follows:

Product.	Lighter than 63 pounds per 100 square feet. Pounds.	63 pounds per 100 square feet and heavier. Pounds.	Total. Pounds.
Tin plates	307,965,826	47,381,844	355,347,670
Terne plates	84,131,032	7,503,361	91,634,393
Total	392,096,858	54,885,205	446,982,063

These figures show that about 88 per cent. of the production belonged to the class of plates weighing lighter than 63 pounds per 100 square feet, the proportion being slightly larger than that for the previous fiscal year, which was more than 86 per cent. The report embraces the production of 50 firms, or three less than that for the fiscal year ended June 30, 1896.

The following comparison shows the records of previous fiscal years:

Production of Tin and Terne Plate.

Fiscal year.	From American black plate.	Per cent. American black plate.	From foreign black plate.	Per cent. foreign black plate.	Total.
1891-1892	9,296,553	68.12	4,350,166	31.88	13,646,719
1892-1893	43,599,724	43.68	56,219,478	56.32	99,819,202
1893-1894	85,968,202	61.74	53,255,265	38.26	139,223,467
1894-1895	160,576,934	82.85	33,224,139	17.15	193,801,073
1895-1896	303,002,098	98.62	4,226,523	1.38	307,228,621
1896-1897	446,924,855	99.99	57,208	0.01	446,982,063

American Sheet Iron and Steel.

The quantity of American sheet iron and steel made by stamping and other manufacturing firms into articles and wares tinned or terne plated, stated by quarters, was:

Quarter ended—	Pounds.
September 30, 1896	1,289,332
December 31, 1896	2,520,943
March 31, 1897	2,723,651
June 30, 1897	2,388,135
Total	8,922,061

The quantity of American sheet iron and steel used in this class of manufactures during the fiscal year ended June 30, 1896, was 10,586,110 pounds.

Black Plate Production.

The production of black plates in the United States during the fiscal year, stated by quarters, was as shown below:

Period. Quarter ended—	Lighter than 63 pounds per 100 square feet. Pounds.	63 pounds per 100 square feet and heavier. Pounds.	Total. Pounds.
September 30, 1896	80,747,945	10,291,444	91,039,389
December 31, 1896	78,064,218	14,684,201	92,748,419
March 31, 1897	99,059,357	16,001,642	115,060,999
June 30, 1897	119,716,892	17,872,336	137,589,228
Totals	377,588,412	58,849,623	436,438,035
Total production fiscal year ended June 30, 1897			436,438,035
Total production fiscal year ended June 30, 1896			334,014,798
The difference is			102,423,237

Showing an increased production of more than 30 per cent.

The production of such plates lighter than 63 pounds per 100 square feet is 86.5 per cent., as compared with 77 per cent. during the preceding year.

Thirty-six rolling mills were producing black plates during the fiscal year ended June 30, 1897, the number being the same as during the previous fiscal year.

Consumption of American Plates.

Of the 50 firms reported as producing commercial tin and terne plates, only one used foreign made plates during a portion of one quarter, the amount being 57,208 pounds, out of a total production by the firm for that quarter of 213,687 pounds.

Of the 53 firms reported as producing commercial tin and terne plates during the fiscal year ended June 30, 1896, 50 used wholly American rolled sheets and three used both American and foreign, with an aggregate output of 15,503,154 pounds. Of this amount, 4,226,523 pounds, or about 27 per cent. of the output, was made from foreign rolled sheets.

Imports and Exports.

The quantity of tin plates and terne plates imported into the United States and entered for consumption during the fiscal year ended June 30, 1897, stated by quarters, was as shown below:

Quarter ended—	Lighter than 63 pounds per 100 square feet. Pounds.	63 pounds per 100 square feet and heavier. Pounds.	Total. Pounds.
September 30, 1896	77,027,181	1,527,595	78,554,776
December 31, 1896	46,014,920	1,259,915	47,274,835
March 31, 1897	60,672.974	802,702	61,475,676
June 30, 1897	56,605,371	496,943	57,102,314
Totals	240,320,446	4,087,155	244,407,601

The quantity of tin plates and terne plates on which duties were paid, and which were used in the manufacture of articles exported with benefit of drawback, during the same period, stated by quarters, was:

Quarter ended—	Lighter than 63 pounds per 100 square feet. Pounds.	63 pounds per 100 square feet and heavier. Pounds.	Total. Pounds.
September 30, 1896	38,954,434	125,376	39,079,810
December 31, 1896	32,905,773	63,394	32,969,167
March 31, 1897	32,998,461	19,625	33,018,026
June 30, 1897	34,156,207	22,920	34,179,127
Totals	139,014,815	231,315	139,246,130

The foregoing figures show:

Comparison of Production and Net Imports.

	Pounds.
Total imports during fiscal year ended June 30, 1897	244,407,601
Total exports same period	139,246,130
Net imports	105,161,471
Total domestic production	446,982,063
Approximate consumption in United States	552,143,534
Average annual capacity of mills completed June 30, 1897, say	600,000,000
Same of mills completed and in process of construction June 30, 1897, say	650,000,000

The figures for the previous fiscal year were as follows:

	Pounds.
Total imports during fiscal year ended June 30, 1896	385,070,372
Total exports, same period	137,659,779
Net imports	247,410,593
Total domestic production	307,228,621
Approximate consumption in the United States	554,639,214
Average annual capacity of mills completed June 30, 1896 (180), say	560,000,000
Same of mills completed and in process of construction June 30, 1896 (188), say	585,000,000

Recovery of Tin from Scrap.

Numerous patents have been taken out from time to time to utilize tin plate scrap, based on processes for separating the tin from the iron or steel. The tin is either rubbed off mechanically, heated, treated chemically by dissolving in caustic soda with the addition of oxidizing agents, or dissolved in acids and separated afterward. Finally there are several electrolytic methods for the recovery of the tin. None of these methods seems to pre-

vent large amounts of tin plate scrap going to waste. Dr. A. Harpf, in *Stahl und Eisen*, proposes to utilize the material in the lead smelter in place of the scrap iron now added. The tin, melting first, would be acted upon by the sulphide of lead, finally coming down in a tin-lead-antimony alloy, which has its uses direct in the arts. Care would have to be taken to keep out all galvanized iron, for zinc would take away the silver, and is a nuisance anyhow.

Dealers' Special Brands.

We are advised by Chas. A. Conklin Mfg. Company, Atlanta, Ga., that the following brands of American terne plates, owned by them, should have been included in *The Metal Worker* List of Dealers' Special Brands printed in our issue of January 1, 1898:

Conklin's Old Style.
Dixie Old Process.
Elmo.
Glen.
Ivy.
Lenox Redipped.
Piedmont.

SCRAP.

Work is progressing rapidly on the new Tin Plate plant of the Laughlin Nail Company, Martin's Ferry, Ohio, notwithstanding unfavorable weather for building operations. The structural iron portion of the new building is nearly all in place, and it is expected that the new plant will be ready for work about March 1.

A strong side light is thrown on the results achieved by the American Tin Plate industry in the annual statement presented to the stockholders of the E. P. Breckinridge Can Company of Toledo, Ohio. It was not very long ago that the company in question, who operate one of the largest factories in the country devoted to the production of Tin Cans and other Tinware, found it necessary to import all of their raw material. Last year they used 65,000 boxes of American made Tin Plate, and not a single box of the British product was received. Moreover, the company were able to buy the American Plate at about $1 a box less than that of foreign manufacture. The advantage gained in this instance by the establishment of the domestic Tin Plate industry is obvious.

The latest issue of *Griffiths' List* shows that at the end of 1897 15 Tin Plate works in South Wales and Monmouthshire were idle or for sale. These works possess an aggregate of 101 mills. Among them are such well-known plants as the Worcester, Port Talbot, Pontypool, Machen, Pontymister, Lion, Abertillery, Gwendraeth, Burry and Ashburnham works, many of which are never likely to run again.

The *Industrial World* of Swansea, Wales, in summing up the result of last year's struggles to maintain the 1874 wage list, is forced to admit that "since the present union was established the close of a year has not seen Tin Plates in such a plight as they are in at present."

The Tin Plate mills have been heavy buyers of Billets and Tin Plate Bars since the opening of the year. It is reported that the orders from Pennsylvania and Indiana mills alone have footed up to about 75,000 tons.

The Wells & Nellegar Company, 72 to 76 Lake street, Chicago, are increasing their facilities by securing lofts in adjoining buildings. They will then be enabled to carry larger stocks of Hardware and make more prompt shipments to supply their rapidly increasing trade.

Marshall Brothers & Co., Philadelphia, have ordered a No. 2 Mesta Pickling Machine from the Leechburg Foundry & Machine Company, Pittsburgh, Pa.

A press dispatch from Pittsburgh, Pa., of January 13, states that a meeting of Tin Plate manufacturers will be held in that city on Tuesday next to receive and consider the report of the special committee appointed at the meeting of the manufacturers at Columbus, Ohio, the week before last.

A press dispatch from Easton, Pa., reports that F. M. Hower, one of the best known slate operators in Pennsylvania, has sold his slate land of 62 acres, quarry, buildings and entire manufacturing plant at Danielsville to the Hower Slate Company, organized under the laws of West Virginia. The president is Edwin T. Rice, Jr., of New York, and the secretary and manager, Charles A. Morrison of Easton. The capital is all English, and the real buyers are represented by F. C. Davis and A. Hilt of London. It is understood Mr. Hower will receive about $200,000 for the plant.

Railroad Building in 1897.

Reports received by the *Railroad Gazette* up to the time of going to press indicate that the building of new railroads in 1897 was a little less than for the year before and a few miles more than the total reported for 1895, though still far short of that in 1890 and earlier years. Official reports from the various companies show a total mileage built during the year, not including second track and sidings, of 1604.17 miles. To this must be added 223.75 miles, which the news columns of the *Railroad Gazette* show to be completed by the close of the year, giving us 1827.92 miles, pretty accurately verified. There are a number of roads on which it is known that grading has been completed and track laying is in progress. The exact amount of track laying, however, it is impossible, at this time, to state, but it is estimated to be not less than 110 miles. This makes the total probable railroad building during 1897, 1937.92 miles, of which all but 333.75 miles is official. Of course, reports from roads not yet heard from will somewhat modify these results. We give below the official and estimated mileage by States, omitting, however, the 110 miles, which has probably been completed, but of which we have no definite record:

NEW RAILROAD BUILDING IN 1897.

States.	Official.	Estimated.	States.	Official.	Estimated.
Alabama	114	.....	Missouri	61.7	31.5
Arkansas	84.5	.....	Montana	13.9	.....
California	169.06	23	New Jersey	10	.....
Colorado	35.33	.....	New York	27.02	.....
Delaware	.....	25	North Carolina	47.38	5
District Columbia	2	.....	North Dakota	36.29	.....
Florida	1	.....	Ohio	.28	5
Georgia	73.45	24	Oklahoma Terr	27	.....
Idaho	21	.....	Oregon	31	.....
Illinois	105.85	11	Pennsylvania	142.09	.....
Indian Ter	.8	.....	South Carolina	10.5	.....
Iowa	.....	8	Tennessee	15	.....
Kansas	1.73	.....	Texas	80.95	16.5
Kentucky	8.35	12	Vermont	.....	3.25
Louisiana	129.5	.....	Virginia	19.65	.....
Maine	19.35	.....	West Virginia	51.5	.....
Massachusetts	5.26	.....	Wisconsin	62.8	28
Michigan	98.71	27			
Minnesota	38.32	4.5	Totals	1604.17	223.75
Mississippi	55.9	.....			

The 110 miles of probable new road, not included in the above, is distributed as follows: Arkansas, 12 miles; California, 18; Georgia, 36; North Carolina, 10; Ohio, 10; Oklahoma Territory, 11; Tennessee, 12, and West Virginia, 8 miles.

It is interesting to make comparisons with previous years. According to "Poor's Manual," which appears about six months after the close of the calendar year, and is therefore in position to gather up practically all the construction of the year, the new building for 1896 was 1996.72 miles, or about 59 miles more than the total estimate here given for 1897. In 1895, which is the low water mark in railroad construction, the mileage was 1922.25. Poor puts the new construction in 1894 at 2263.97 miles, in 1893 at 2789.02 miles, in 1892 at 4584.01 miles, in 1891 at 4620.41 miles and in 1890 at 5656.7 miles.

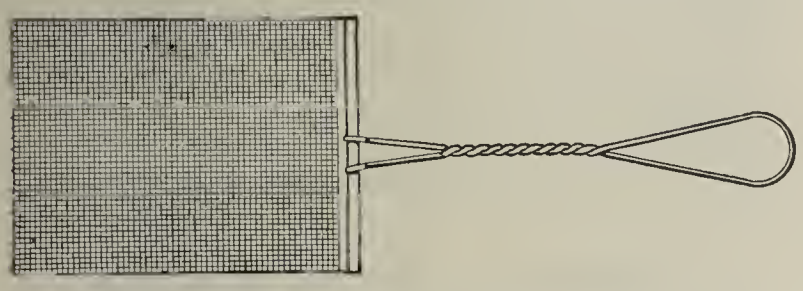
TRADE NOTES.

Among recent incorporations is that of the American Brass & Copper Company of New York City, N. Y., with $50,000 capital. W. E. Hawkins, F. T. Mercer and W. H. Platt are the directors named.

The Coale Brass Mfg. Company of Baltimore, Md., have been incorporated, with a capital of $15,000, by J. M. Coale, F. W. Coale and W. J. O'Brien.

The Detroit Copper & Brass Rolling Mill Company, Detroit, Mich., have contracted for the erection of a large addition to their present plant.

The Ohio Brass & Iron Mfg. Company, Cleveland, Ohio, will erect a new building at a cost of $7000.



A charter has been issued to the Asbestos Mfg. Company of Philadelphia, Pa., with a capital of $20,000. The incorporators are: W. Harris Seitzer, Alvin M. Ehret, Harry S. Ehret, Michael Ehret, Alonzo Gibbons.

The latest cable advices from London state that there are signs that the end of the great strike in the engineering trades of Great Britain is approaching. Large numbers of Glasgow engineers have applied for reinstatement, and a meeting of the engineers of Fairfield decided to continue work, in spite of their previous threats to strike when the first 25 per cent. of their number were locked out.

THE RETAIL STORE.

The Champion Fly Killer.

We show in the accompanying illustration the Champion fly killer, made by Henry E. Dean & Co., 180 Austin street, Worcester, Mass., makers of kitchen goods and

The Champion Fly Killer.

wire specialties. The manufacturers point out that this fly killer is light to handle, is not readily broken, is very effective and does its work in a clean manner.

Bolt or Rivet Cutters.

The Peck, Stow & Wilcox Company, 27 Murray street, New York, are manufacturing two bolt or rivet clippers, as here shown. Fig. 1 is their No. 21 Lindsay's compound lever bolt cutter, forged, with polished steel jaws, and is said to cut rods ⅜ inch in diameter. Fig. 2 represents Nott's No. 23 compound lever bolt cutter, with detachable and interchangeable cutters, powerful enough to cut ½-inch bolts. Both tools are 27 inches long, and they are provided with buffers to prevent damage to the cutters when the bolt is cut through.

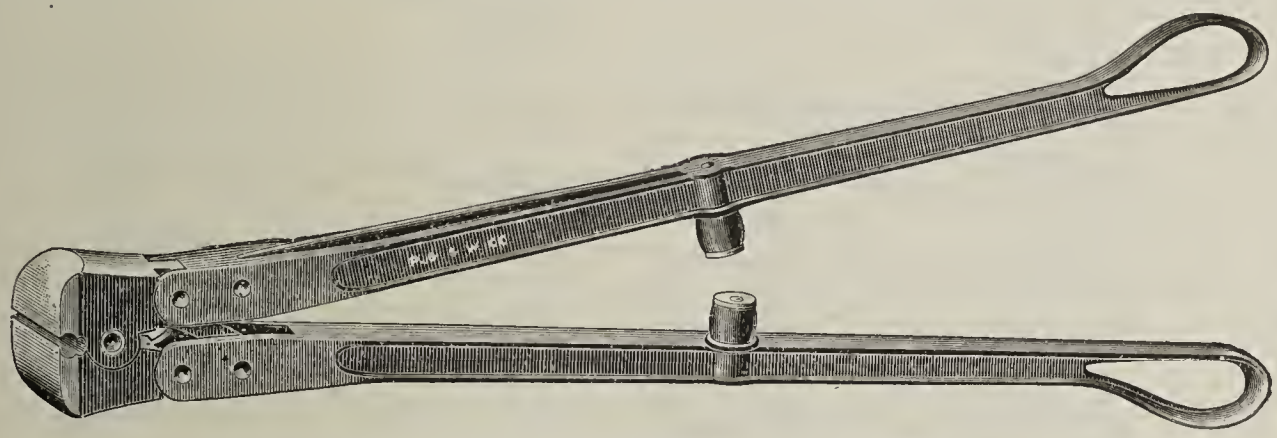


Fig. 1.—Lindsay's Compound Lever Bolt Cutter.

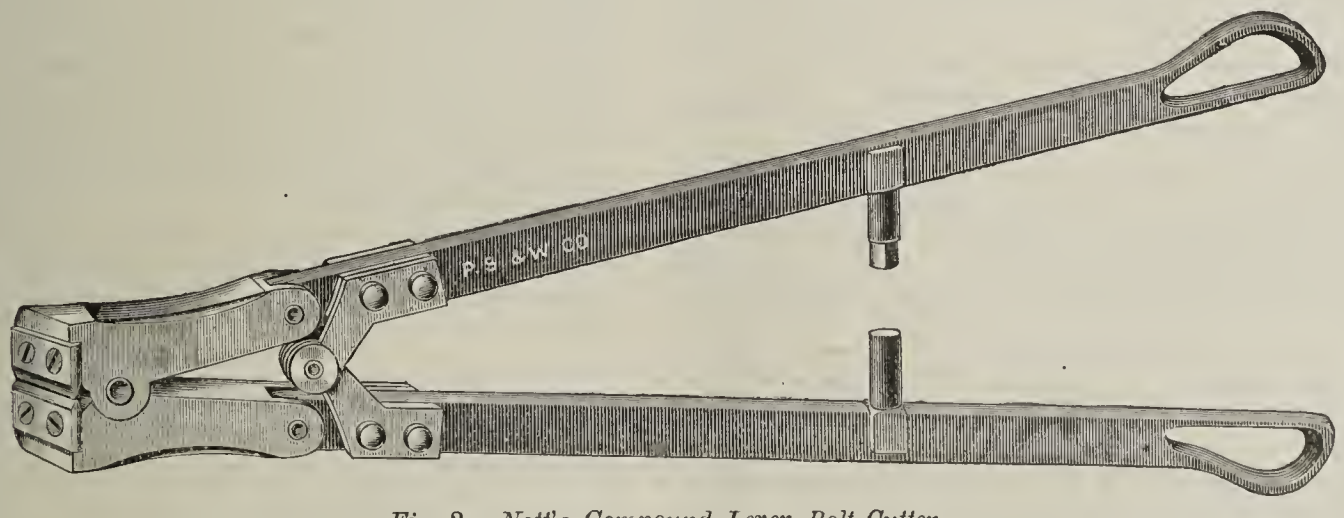

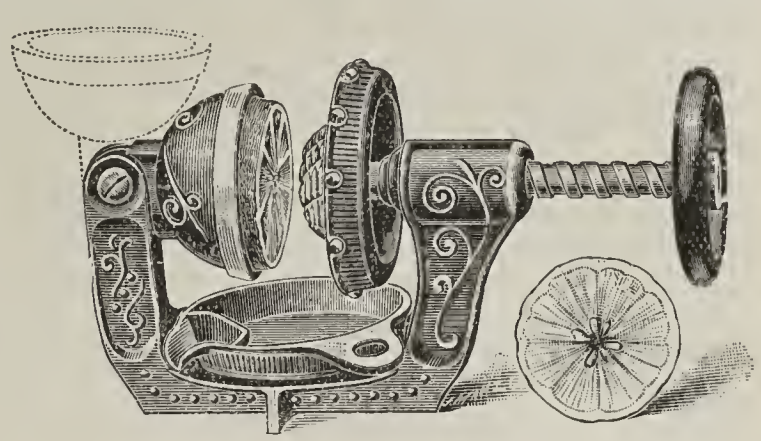

Fig. 2.—Nott's Compound Lever Bolt Cutter.

Lemon Squeezer and Cork Puller.

H. H. Beaumont, 203-205 Grand avenue, Milwaukee, Wis., Wm. H. Jacobus, Eastern agent, 90 Chambers street, New York, is the manufacturer of the Album lemon squeezer, here illustrated. It is designed for pressing lemons, beef, onions, fruit, &c. The dimensions are about 7½ x 4 x 5 inches, the solid removable aluminum saucer being 3 inches in diameter. The pitch of the composition screw insures a rapid action and it is run through babbitted metal. The device is supplied with a detachable plate for attaching to wall or wainscoting, so that the squeezer can be instantly lifted out and carried about for

Album Lemon or Fruit Squeezer.

use. If a quantity of any juice is required the cup can be tilted by raising the back on a ridge provided, so that as the liquid accumulates it can empty itself into another receptacle, the strainer in the cup keeping back any seeds or pulp which may escape in the operation. It is recommended by the manufacturer for use in families, hotels, clubs, restaurants, drug stores, hospitals, saloons, &c.

L. W. Seabolt of Winston, N. C., sole agent for Garland Stoves and Ranges, utilizes the local papers for some rather novel announcements. In one of these, which appeared not long since, he states that "the tide has turned from Klondike to the State of Matrimony, which is one of the United States." To those who are taking a trip to this interesting state it is suggested that the principal road leads via 112 West Fourteenth street, Winston, N. C., which, of course, is Mr. Seabolt's establishment, where the necessary outfit of House Furnishing Goods can be secured. He also intimates that the climate will be sultry as the tropics of housekeeping are passed unless a Garland Stove is purchased, which, as he put it, "will keep all hands as cool as cucumbers."

Minnesota Retail Hardware Association.

At a meeting of the Executive Committee of the Minnesota Retail Hardware Association, held in St. Paul, January 4, it was decided to hold the next annual meeting in Minneapolis, February 9 and 10. The following members of the committee were present at the meeting: C. F. Ladner, St. Cloud, president; James E. O'Brien, Crookston ; Clement Schroeder, Mankato ; M. R. O'Neill, Graceville ; E. A. Moye, Duluth ; W. H. Tomlinson, Le Sueur ; C. F. Stremel, Minneapolis. The work of the past three months was reviewed and the result proved very gratifying to the committee. During this time 125 dealers became members of the association, making it as large as any, if not actually the largest, Hardware association of retailers in the country. Among the persons who are affiliated with the association are many of the largest dealers in the State, men of influence and financial responsibility. The members of the association are now fully assured of the success of their movement for the protection of the trade. It was decided to extend a cordial invitation to all retail Hardware dealers in the States of Minnesota, Wisconsin, Iowa, North Dakota, South Dakota and Nebraska to meet with them and participate in their next annual meeting as above. At this meeting the trade conditions, the evils thereof and the remedies therefor will be taken up through papers read by the members, to be followed by a general discussion. As these questions are of vital importance to the dealers, much profit must result to those who attend.

The Executive Committee also considered the question of organizing a Northwestern association, and adopted the following resolution :

Resolved, That it is the sense of this committee that at our next annual meeting a committee of three be appointed to meet like committees to be appointed by the Wisconsin and North Dakota Associations to consider the advisability of organizing a Northwestern Association of Retail Hardware dealers, and to formulate by-laws and resolutions to govern the same That this committee be subject to the call of the president of the Minnesota Retail Hardware Association.

We are advised that arrangements have been made for reduced railroad rates, and that a fare and a third will cover the round trip. Further particulars can be obtained by addressing the secretary of the association, J. W. Clark, 901 New York Life Building, St. Paul.

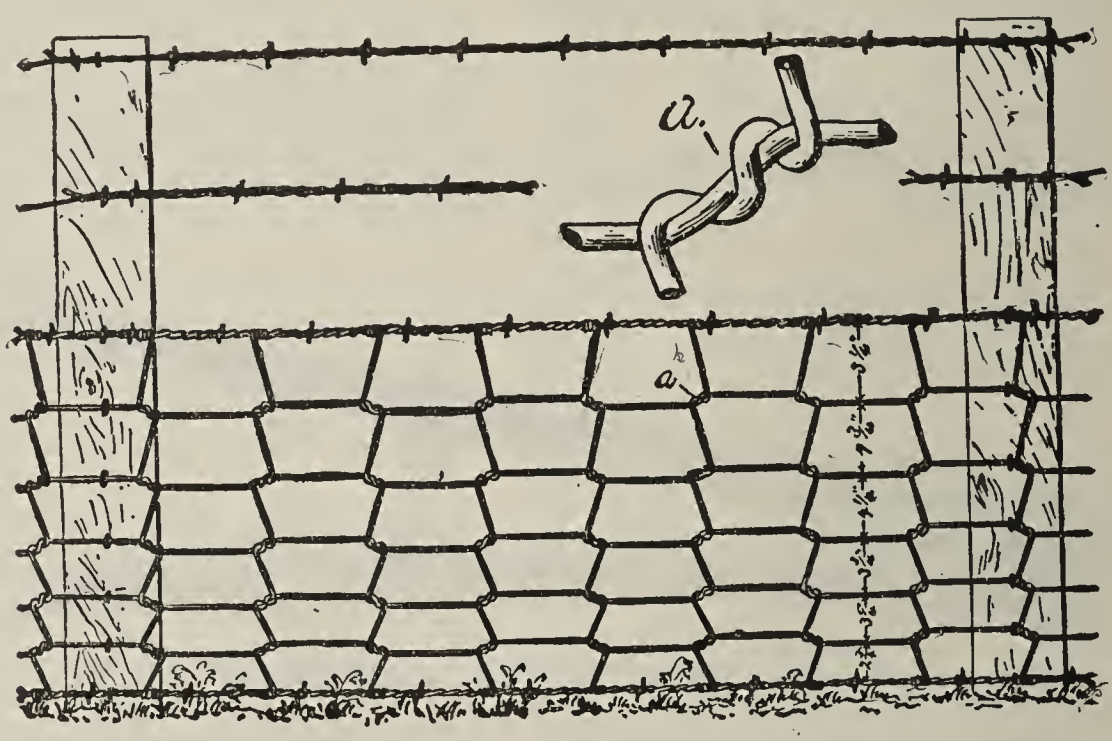
Call for a Hardware Association in Pennsylvania.

The following letter from a well-known Hardware merchant will be read with interest by many Hardwaremen in Pennsylvania who are doubtless familiar with the troubles with which business is contending and the abuses which it is hoped may be in a greater or less degree corrected by concerted action. The letter of Mr. Fredericks is the result of consultation with other prominent merchants, and Hardware merchants in all parts of the State are requested to communicate with him without further notice. The movement is to be heartily commended, and we trust it will receive the active co operation of the trade :

To the Retail Hardware Dealers in Pennsylvania:

Believing the time has arrived when there should be an Association of the Retail Hardware Dealers in this State, I take this opportunity of inviting correspondence on the subject, expressing views as to the best location for a meeting and the time to call the same.

There are evils connected with the retail Hardware business that can be very materially corrected by a complete organization or association of this kind.



Let us get together and exchange views on this subject.

Address your communication to

J. H. FREDERICKS,
120 East Main Street, Lock Haven, Pa.

Warmer's Combination Wire Fence.

Combination Wire Fence Company, 5 East Levee, Kansas City, Mo., are manufacturing Warmer's combination fence, herewith illustrated. The distinctive feature of this commodity is the barbed top and bottom wire and that it is made of continuous wire by a special process of weaving. Fig. A in the cut is an enlarged detail showing the form of twist. The strong stay wires top and bottom are said to make sagging, bending or swinging over impossible, keeping cattle and hogs securely where they are put. We are advised the fence is made of the best galvanized steel wire, No. 12½. The fence is variously made with stays 10, 8 and 6 inches apart in hights as follows: 15, 20, 26, 32, 38, 48 and 52 inches. Fencing with stays 6 inches apart is put up in 15-rod rolls, the two other kinds in 20-rod rolls. The company refer to the fence 26 inches high with 10-inch stays as their standard size.

Warmer's Combination Wire Fence.

Hagan & Schad, 249-251 Second street, Marietta, Ohio, issue a neat little greeting announcing the beginning of their seventh business year as dealers in Hardware, Cutlery, Tinware, Stoves and Bicycle Goods. It is in pamphlet form, there being 24 pages, 5½ x 7 inches in size, and printed in a tint of brown ink. On the first page is a view of their store, showing "The place where Hagan & Schad, the live Hardwaremen, do business." After two pages of greeting to the public, headed by an illustration of an owl grasping a bludgeon in one claw, emblematic of knock down wisdom, come sundry pages illustrating and describing various specialties, some of which are priced. Toward the end is a page headed "This is our force." Then follow the names of the firm and employees grouped variously under the headings Store, Bicycle Shop, Gas Fitting Shop, Tin Shop, Office, and Drayman. The last page gives the location of the fire boxes in the six wards of the city.

MEMORANDA.

The Simmons Hardware Company, Incorporated, St. Louis, Mo., do not propose to let all the Klondike trade go to the Pacific Coast, and with a view to capturing some of it they have issued Circular 290, devoted particularly to Klondike outfits. These show Hardware, Campers' Supplies, Clothing, Belts, &c., while on the back of the poster is a map of the Klondike, information about the different routes and a list of necessary supplies and of things to eat and to wear.

The illustrated catalogue for 1898 issued by the Lisk Mfg. Company, Limited, Canandaigua, N. Y.. is a volume of convenient size containing over 70 pages and bound in heavy red paper with front cover decorated in silvered design. A general view of the works at Canandaigua serves as a frontispiece to the catalogue, after which the various goods made by them are illustrated, beginning with Pails of various sizes and shapes. Pans, Kettles, Boilers, Coffee and Tea Pots, Measures, Cups, Oil Cans, Bathtubs and Toilet Sets are some of the other goods noted in this catalogue.

D. G. & D. H. Donaldson, dealers in Stove Repairs, Buffalo, N. Y., have purchased the property at 50 South Division street, that city, where they will soon put up a brick business block for their own use. The lot is 22 x 77 feet.

An enterprising shopkeeper, says the *Pottery Gazette*, London, has hit upon a novel notion by which to draw attention to his window of Fancy Goods. In a conspicuous position he placed a large white card, whereon was inscribed, in flaming red letters, the following luring legend: "I have placed in my window a dozen articles actually marked below cost price. Any person selecting these articles may have them at the price stated." This unique offer naturally resulted in a good deal of speculation on the part of the bargain seeking public and led to a marked increase of trade.

The Stove and Tinware establishment of P. H. Von Blon of Upper Sandusky, Ohio, was recently damaged by fire, but the loss was fully covered by insurance.

In the death, which occurred last week, of Jacob Pfau, Sr., the well-known Stove dealer, Cincinnati loses one of its oldest and most respected citizens. He went with his parents to Cincinnati when only seven years old, and lived there 61 years with the exception of four years when he was in California during the excitement incident to the discovery of gold in that State. He started in the Stove business in Cincinnati 32 years ago, and about the same time was married to Miss Mary Smith, who with three children survive him. The funeral services were held from his late residence, 415 Chestnut street, on Wednesday of last week. There was a large attendance of the older and prominent citizens, including a delegation from the German Pioneer Society, of which Mr. Pfau was one of the first members.

William Gray, formerly connected with the Boynton Furnace Company of New York City, has recently been taken into the firm of Whitcomb & Kirkham, Stove dealers, at 140 State street, Springfield, Mass. The business will be conducted under the style of Whitcomb, Kirkham & Gray.

The Hill-Whitney Aluminum Company, Boston, Mass., issue a neat catalogue and price list of 22 pages calling attention to the high grade cooking utensils made from special hard aluminum. In an introductory note they state that their metal is an improvement on the pure metal which retains all the essential properties, but has a high tensile strength and is entirely free from poison. The special advantages of aluminum for cooking utensils are alluded to. The first part of the catalogue is devoted to utensils made from sheet metal, including Saucepans, Pudding Pans, Kettles, Boilers, Coffee Pots, Fry Pans, Pie Plates, Measures, Cuspidors, Pitchers, Chafing Dishes, &c. In cast aluminum the goods noted include Ladles, Broilers, Fry Pans, Tea Kettles and Steam Cookers. There are also a few cast iron and sheet iron utensils referred to in the catalogue. All the goods are illustrated and prices given.

The firm of Genesy & Savage, composed of F. C. Savage and B. J. Genesy, are opening a new store at Reno, Nev., where they intend to carry a full line of Plumbers' and Tinners' Goods and Supplies, also Stoves, Kitchen Furniture, &c. They would like to receive catalogues from manufacturers of all goods in the lines which they deal in.

James M. Horton, of the late firm of Horton, Gilmore, McWilliams & Co., Chicago, is now with Hibbard, Spencer, Bartlett & Co. and thus continues his connection with the Hardware trade. Mr. Horton has been deeply touched and at the same time gratified by the warm expressions of sympathy and regard received from many of his old customers, whose acquaintance dates back to the days of William Blair & Co. Mr. Horton's friends in the trade will find him occupying a desk in the general office of Hibbard, Spencer, Bartlett & Co., and they will be greeted with his habitual genial welcome, which has not been altered in the least by recent untoward circumstances.

Hibbard, Spencer, Bartlett & Co., Chicago, in addition to their great stores at Lake street and Wabash avenue, have for years maintained a capacious six-story warehouse a few blocks north, in which heavy or bulky goods are stocked. They have recently found it desirable to add more storage space and have secured a building adjoining their warehouse, which is fully as large. The stock of all kinds of Hardware carried by this house is so large that the two stocks carried by John Alling & Co. and Horton, Gilmore, McWilliams & Co. were easily absorbed. The additional warehouse facilities were not provided on this account, but by way of preparation for the immense increase in business which is expected this year as a result of the generally prosperous condition of the country.

J. T. Mercer & Co. have opened up a new store in Blunt, S. Dak. Shelf Hardware, Stoves, Implements, Tinware, &c., are carried.

E. T. Matthews has succeeded to the business of the Higbee Hardware Company, Bloomfield, Iowa. The stock comprises Shelf and Heavy Hardware, Stoves, Implements and Tinware.

Martin & Dixon have succeeded Wilcox Bros., Geneva, Ill., in the retail Hardware, Stove, Tinware, &c., business. Martin & Dixon were formerly located in Canton, S. D.

Graff Bros., Pittsburgh, Pa., will occupy, about April their new three-story brick building, 26 by 130 feet, with a complete line of Hardware, Tools, Paints, Oils, Glass, Stoves, Furnaces and House Furnishing Goods. The basement will be used as a wareroom, the first floor being entirely devoted to storeroom. The second and third floors will be used for Sheet Metal and Cornice Work.

The Grand Rapids Furniture Company, Grand Rapids, Mich., have recently organized a new department of their business. They will hereafter manufacture a complete line of carpet sweepers, making all kinds and sizes. This new department will be in charge of E. H. Taylor, formerly sales manager of the Goshen Sweeper Company, at Grand Rapids. Greenough, Desmond & Raleigh will represent them in the East. A more detailed statement of the company's intentions will be issued as soon as their arrangements have been fully completed.

Dillingham Mfg. Company, Sheboygan, Mich., have lately issued a new catalogue of New Iceberg hardwood refrigerators. The outer case of these refrigerators is made of kiln dried ash, with the parts so joined as to make a perfectly tight cabinet. The inner case is made of odorless lumber covered with Bird's patent water proof sheathing, claimed not to absorb moisture, shrink or swell. The inside is lined entirely with zinc. A dead air space is secured which is not filled with any substance. The favorable reports received from customers and the growing demand for these refrigerators are alluded to as demonstrating the satisfactory principle of the construction adopted. Air ducts secure circulation of cold air through the provision chamber. The styles shown comprise a wide variety of sizes and finish, including plain and sideboard constructions, single and double doors, low refrigerators, ice chests, grocers' sizes, beer coolers, &c.

W. J. Henry & Co. have opened up in business in Valparaiso, Ind. They are carrying a stock comprising Shelf Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

F. J. Baldwin has recently opened up in the Hardware and Stove business in Burlington, Kan. Mr. Baldwin will be pleased to receive catalogues and other printed matter from wholesalers and manufacturers in his line.

The Reeves Iron Company, Canal Dover, Ohio, for whom W. C. Brown, Northern Office Building, 36 La Salle street, Chicago, is Western sales agent, have recently begun to manufacture Galvanized Sheets made of Puddled Iron. They will continue the manufacture of Steel Galvanized Sheets, but believe that many Sheet Metal workers desire to be able to get Iron Sheets for special purposes, and are therefore ready to supply that special trade. Each Iron Sheet will be stamped with a die and guaranteed to be made of Puddled Iron. The price will be a little higher than that quoted on Steel Sheets, as the cost of production will be greater.

Graduation exercises and an exhibition of the work of the students in the Baron de Hirsch Trade Schools were held on the evening of Saturday, January 8, in the school buildings, 225 and 227 East Ninth street, New York City

STOVE TRADE NOTES.

TRAVELING SALESMEN FOR 1898.

Monarch Stove & Mfg. Company.—In addition to the list of salesmen and agencies already announced in connection with the Monarch Stove & Mfg. Company of Mansfield, Ohio, B. F. Blymyer, successor to H. R. Hamilton, 67 Lake street, Chicago, Ill., is the agent for the Monarch goods in the States of Indiana, Illinois and Northern Iowa; George Haw & Co., Ottumwa, Iowa, will have control of the Monarch goods for Southern Iowa and Northern Missouri, and Roberts, Parry & Co., Utica, N. Y., for the territory tributary to that city. At all these points stocks will be carried for the prompt shipment of orders.

Eugene Munsell & Co., 218 Water street, New York City, will be represented by the following salesmen, who will look after their goods in the territory indicated: C. William Dettermusch will travel in New York State and Western Massachusetts; Rufus Van Valkenburgh in New Jersey and Connecticut; C. W. Yasinski in the Greater New York; G. W. Elliott in Eastern Massachusetts and Rhode Island; E. C. Wood in Delaware and Eastern Pennsylvania; Charles E. Coleman in Western territory; and August Krieg will look after the architects' and builders' trade in Greater New York.

Syracuse Stove Company of Syracuse, N. Y., have made arrangements with the following travelers to represent their goods: George N. Pickstock will cover Eastern Ohio, Western New York and Northern Pennsylvania; Rufus Daggett will cover Northern New York, Central New York and Northern Pennsylvania; and Charles A. Grey will cover Vermont, New Hampshire, Eastern New York and Eastern Pennsylvania. Their New York City office will be continued at 105 Beekman street.

The Thomas White Stove Company, Quincy, Ill., will have their interests looked after during 1898 in the territory indicated by the following salesmen: Henry Wilson in Missouri, Kansas, Oklahoma and Indian Territory; M. Kirtley in Illinois and Missouri; J. H. McAfee in Iowa and Missouri; C. W. Shinn in Iowa, Minnesota, Wisconsin and South Dakota; and W. H. Wood in Missouri, Kansas and Nebraska.

The Richmond Stove Company, with works at Norwich, Conn., have arranged with B. E. Mallory to take orders for stoves, ranges and boilers, and with F. A. Leland he will visit the trade in the interest of the company's ranges and boilers. D. W. Clark, formerly of the Model Heating Company, will take care of their boiler and furnace trade. All these salesmen will make Norwich their headquarters. The company's New York office, at 85 Centre street, will be managed by C. F. Hauss, who has been with them so long. From this point will travel Thomas C. Fleming, formerly with the Griffing Iron Company, who will look after the trade in New York and suburbs in connection with Mr. Hauss. The trade in Brooklyn and vicinity will be looked after by J. S. McGee, while Western New York and Pennsylvania will be covered by W. J. Kennedy, who will make the New York office his headquarters. The company have all the men they require just at present, but they may decide later on to add to the above two or more men.

J. Elwood Yeager, Philadelphia, will be represented this year in Western Pennsylvania by W. G. Withers, who has just started out on an eight weeks' trip through that territory. H. F. Tyson takes the New Jersey territory, and will start out on the 17th inst. Mr. Yeager is sales agent for the New Era blue flame oil stoves made by the Yeager-Hunter Spring City Stove Works, Spring City, Pa., under license from the United Blue Flame Oil Stove Company.

Rathbone, Sard & Co.'s Chicago Office.

Rathbone, Sard & Co., manufacturers of Acorn stoves and ranges, will make an important change in their Western business arrangements in April. Hitherto their main Western office has been located in Chicago, while their stove works are at Aurora, Ill., 40 miles distant. When the Aurora works were started, eight years since, this arrangement was quite satisfactory, as fully half their shipments of stoves to Western customers were made from their Eastern works, at Albany, N. Y. But with the flight of years important changes have occurred. The capacity of the Aurora plant has been increased and its facilities improved so that it wholly supplies their Western trade. The inconvenience of having the office 40 miles from the works was a comparatively small matter under the conditions prevailing a few years since, but now it has grown to be a serious matter, involving delays and all sorts of petty annoyances, notwithstanding modern methods of quick communication. In April, therefore, the clerical force now employed in Chicago will be removed to Aurora, including the manager, Edmond Raftery. The vice-president, Wm. H. Sard, will retain his residence in Chicago, and a branch office and sample room will be maintained at the present location, Wabash avenue and Randolph street, for the convenience of the large city business which the company enjoy. The concentration of the business and manufacturing departments at Aurora will enable business thereafter to be handled much more expeditiously, and, doubtless, much more satisfactorily to the trade.

Jewel Security Trade-Mark.

An illustration is herewith given of the new trade-mark designed by George M. Clark & Co., 72 to 76 Lake

Jewel Security Trade-Mark.

street, Chicago, for special use on their new Jewel Security gasoline stoves. It will be observed that it is in the form of a key, which is a symbol of security. A jewel is in the handle, and thus the firm's time honored name for their line of stoves is preserved in due connection.

ODD PLATES.

The Bellaire Stove Company of Bellaire, Ohio, have awarded to Jones & McGraw the contract for their new building, which will be 72 x 75 feet, and will adjoin the present foundry on the west side. They have also contracted with Dubois & McCoy for the remodeling of their pattern shops, and when the improvements are completed they will about double the manufacturing capacity.

The friends of the Weir Stove Company, Taunton, Mass., are to be congratulated on the handsome Glenwood desk calendar which they receive this year as a reminder of the well-known Heaters and Ranges of this firm. The calendar is a leather case of convenient size, with a pocket for holding the monthly cards, a supply being furnished for two years, making it literally a *fin de siècle* calendar.

The firm also distribute the Glenwood card calendars, which they are furnishing in quantities to their customers for general distribution. These are very pretty cards, daintily decorated with colored prints, making a modest reference to the Glenwood Ranges and carrying at the lower end a neat little calendar for 1898.

The Sun Vapor Stove Company filed articles of association at Detroit, Mich., on Friday, December 31. The capital stock, all of which is paid in, is $100,000. The stockholders are Edward G. Mummery, Robert S. Hutton, William G. Hastie and N. S. Wright.

Graff & Co. of Pittsburgh, Pa., resumed operations last week after a brief shut down for the usual inventory and repairs.

Fletcher, Russell & Co. of Warrington, England, send us a copy of one of their recently issued catalogues relating to Gas Heaters and Laboratory Appliances, the latter goods occupying the greater portion of the volume. The printing is beautifully done upon a fine quality of paper, and the binding is in embossed paper covers. The Laboratory Appliances cover a wide range, and the volume will be found of special interest to the trades addressed.

In *The Metal Worker* of January 1, page 37, we alluded to the corporation of the Walterstorff-Haskell Range & Furnace Company as being located in Minneapolis. This, however, is a mistake. The firm, as the trade well know, are now and have always been located in St. Paul, Minn., where they succeed the former business of the Walterstorff-Haskell Mfg. Company.

W. G. Creamer & Co., 96 John street, New York City, issue a catalogue for the year 1898 describing and illustrating the extensive line of Registers which they manufacture. In a special notice to buyers they state that they have made Hot Air and Ventilating Registers for more than 25 years, and call special attention to some of the special features of their goods. Their Flat Faced Registers are operated by a lever which permits easy adjustment with the foot and can be made to lock in any desired position. They also call attention to the Convex and Half Convex Registers. A number of other features are noted in their announcement which will interest the trade. The catalogue contains 44 pages and some of the goods are shown on colored paper, which permits the effective use of gold and silver printing. Full lists of prices and sizes are given.

The Phillips & Clark Stove Company, Geneva and Troy, N. Y., and Chicago, Ill., are distributing a calendar for the new year which is so arranged that it may be hung up or utilized as a card easel. The calendar proper is in the shape of the printed matter usually found in connection with the pocket memorandum books so extensively circulated during the past few years. The leaves are attached to the card in such a manner that a string passes over the front, thus holding the leaves open at any page or date desired. There are also yearly calendars for 1898 and 1899. It is referred to as a daily reminder, calendar, diary and memorandum combined, and is copyrighted by the Matthews-Northrup Company of Buffalo, N. Y.

We have received, with the compliments of the Bussey & McLeod Stove Company, Troy, N. Y., a very attractive calendar for the new year in the shape of a large card embellished with an oblong panel with a steel engraving entitled "Harvest Time." Below the panel are the leaves for the different months of the year, and also a yearly calendar. At the right is an inscription referring to the company's new line of Ranges, Parlors and Cooks for 1898, concerning which it is stated that no pains or expense have been spared to make them the best. Accompanying the calendar is a New Year's greeting, in connection with which the manufacturers state that it is intended this year to put out a line of Gold Coin Stoves and Ranges far in advance of all competitors. The new goods comprise a six-hole Grand Gold Coin Range, a four-hole Novel Gold Coin Range, two medium priced Ranges, a line of medium priced Steel Ranges, a new line of Base Burners and a new line of Oak Stoves.

The Richmond Stove Company of Richmond, Va., send us with their compliments a very pretty calendar for 1898 in the shape of a poster carrying the picture of a little girl holding in her hand a basket of flowers. She stands before a Japanese screen, the whole design being lithographed in bright and varied colors. The poster is bound at the top and bottom with a metal strip, and there is a metal eye for hanging it upon the wall.

De Haven & Co., Limited, Allegheny, Pa., issue a pretty little card wishing their friends a Happy and Prosperous New Year and many of them. In a neat folder which they are sending out they state that they will present for the spring trade a new line of Ranges, known as Duchess Cinderella, containing "some good ideas that are departures from the ordinary lines of Stove architecture." The departures, the manufacturers are satisfied, will meet the views of every well posted dealer and win the approval of the purchasing public. The Duchess Cinderella, it is said, will be "bright and attractive and will have a distinct individuality not found in any other line of ranges." Their salesmen will tell the trade more about them, and at the same time will show photographs of the goods.

D. G. Brennan, for many years connected with J. H. Woodruff & Co., but latterly with the Victor Stove Company, Salem, Ohio, has severed his connection with the company and accepted a position with the Fuller-Warren Company of Milwaukee, Wis.

The Taunton Iron Works of Taunton, Mass., makers of the Quaker Ranges and Heaters, are distributing with their compliments an exceedingly attractive calendar for the new year, in the shape of a large card provided with a silken loop for hanging it up. The card is of liberal proportions, measuring 11 x 14 inches in size, and has the greater portion of it devoted to a marine view showing the United States frigate "Constitution." Beneath the picture is a very brief history of "Old Ironsides," as the "Constitution" was familiarly known, together with a stanza from the well-known poem relating to the ship by Oliver Wendell Holmes. Across the center is the name and address of the company, together with a *fac-simile* of their trade-mark and an indication of the lines of specialties which they manufacture. The leaves for the different months of the year are printed in bold black figures upon a white ground, and give, in addition to the days of the week and month, the various phases of the moon.

At a meeting of the stockholders of the Yeager-Hunter Spring City Stove Works, held at Spring City on the 1st inst., the following officers were elected for the ensuing year: J. G. Yeager, president; J. Edgar Diemer, vice-president; J. Elwood Yeager, secretary; J. Evans Yeager, treasurer; and J. G. Yeager, J. Edgar Diemer, J. Elwood Yeager and A. Lincoln Tyson, directors.

Wm. Mackey & Sons, South Haven, Mich., have issued a neat catalogue, comprising 20 pages, setting forth the specialties which they manufacture. These consist of the Columbia four-hole Range, for wood; the Columbia, Waverly and New Waverly Cook Stoves, for wood, and the Roanoke Oak Stove. These goods are all made in several sizes. The Range and Stoves are supplied in all the usual styles.

The Stove dealers who are now receiving gorgeous envelopes of dark *cerisse* tint, otherwise cherry colored, will very probably find in them an announcement that an early call is to be expected from a representative of the Michigan Stove Company. The announcement is printed on paper of the same hue, that being one of the newest and most fashionable colors now ruling in select circles. The Michigan Stove Company are always to the front in these matters. Some one in that great establishment always knows "the latest." The circular is printed in a style which is radically different from the conventional circular. It folds in a way which suggests a four-page leaflet, but when it is opened that is found not to be the thing at all. The two pages are placed side by side, and face each other when folded, and then the top folds down and the bottom folds up and they fold together in the middle and the thing then looks like a book or something. The back of the circular is ornamented with a green dragon of the most horrifying type.

The Palermo Mica Company, 27 Peck slip, New York, have issued a new 1898 standard price-list of Mica, which differs only slightly from the former list in the smaller sizes. The company's business last year was rather ahead of that of 1896, but they are looking for a very decided improvement in the demand for Mica in the current year. The amount of inquiries already received since the opening of the year indicates a better feeling among consumers.

P. J. Crough has issued a circular letter to his friends in the trade bearing date of January 8, stating that he will represent as heretofore the Phillips & Clark Stove Company of Geneva and Troy, N. Y.

The Lehigh Stove & Mfg. Company of Lehighton, Pa., resumed operations Monday after a shut down of two weeks for the usual inventory and the making of some extensive repairs. We understand that during the year 1897 the plant was idle only 17 days.

The Cincinnati Steel Range Company of Cincinnati, Ohio, have decided to retire from the retail business and devote themselves entirely to wholesaling. They are building a large addition to their plant on Fifth street, in order to meet the demands of their growing wholesale trade.

The annual meeting of M. L. Nyberg & Co., Limited, was recently held at their offices, 1216-1218 Peach street, Erie, Pa. C. H. Hoffstetter was chosen president, E. D. Austin vice-president, John F. Skoog secretary, F. J. Demuling treasurer, and K. M. Wallhauser assistant

treasurer. The company are made up of young men of Erie who are doing an extensive business. Mr. Hoffstetter, who is also the manager, was for some time connected with the Detroit Stove Works and thoroughly understands the details of the business. The company manufacture Gas Stoves and Burners, and deal extensively in Stoves, Ovens, Kitchen Supplies, &c.

The Phillips & Clark Stove Company announce from their office at Troy, N. Y., that Hugh R. Chambers, who has been connected with the company for many years, will hereafter be located at the home office in Geneva, N. Y., as manager of the sales department. John H. Manns, for the past 16 years with Burdett, Smith & Co. of Troy, N. Y., will succeed Mr. Chambers in the territory formerly covered by him. The company announce that they are constantly adding new and improved patterns to their already large and extensive line and feel assured that their customers will be pleased with the latest product of their works—the Peerless Andes, a Range which the manufacturers regard as the finest which they have yet turned out.

The Armstrong Stove & Mfg. Company, Perryville, Md., are meeting with a foreign demand for their goods, and we understand they recently closed a contract for some of their Stoves for shipment to Ireland.

Noyes & Goddard of Waterville, Maine, have recently added a new 10 horse-power gasoline engine to their Stove foundry on Chaplin street, which takes the place of a water motor heretofore employed.

The R. H. Moody Stove & Mfg. Company, 741-745 Seventh street, Denver, Col., are steadily developing their business, and although organized only about a year ago have built up a large trade. They turn out high class Soft Coal Base Burners, Cook Stoves and Steel Ranges, and also give attention to all kinds of machinery castings. The Steel Ranges are made in different sizes and adapted to meet varying requirements. R. H. Moody, Jr., the practical head of the establishment, is a young man having a thorough knowledge of foundry work, and gives to all the business his personal and direct supervision. The company also have in connection with their works a finely equipped nickel plating plant.

After a continuous service of 18 years as traveling representative for the Sill Stove Works, Rochester, N. Y., and a total experience of 29 years on the road, Robert B. Johnson of Honeoye Falls has concluded to take a well deserved rest. At an informal gathering of the officers and salesmen of the Sill Stove Works last Tuesday evening Mr. Johnson was presented with a beautiful gold headed cane by the Sill Stove Works as an expression of their appreciation of his services and their personal esteem.

THE IRON MARKET.

The statistics of Pig Iron capacity printed in *The Iron Age* show that, as a whole, production continues at an enormous rate and that apparently consumption has been keeping up with it very well. Unless accidents happen January will be the banner month, with a production slightly exceeding 1,000,000 tons. How rapidly production has been expanding, under the stimulus of a rapidly growing demand, is shown by the following series of figures giving an estimate of the output monthly during the second half of 1897:

	Gross tons.
July	710,000
August	796,000
September	843,000
October	925,000
November	960,000
December	997,000
Total	5,221,000

During that period the stocks at the furnaces, excluding those belonging to Steel plants, have fallen about 275,000 tons.

It may be argued that the present tremendous rate of production, close to 12,000,000 tons per annum, is an element of extreme danger. The modest increase in stocks in December, say 10,000 tons of Anthracite and Coke Iron, proves that the consumption must be enormous, since December usually brings some slackening in the rate of melting Iron. We may even witness further drift in that direction and yet not have cause for alarm.

On the contrary, with the approach of spring we may be forced to face a very different state of affairs, and that is, a scarcity of Pig Iron in spite of a phenomenal output. As a matter of fact, the furnace capacity now available at present price limits is small. There are not a dozen stacks in the Central West which are in condition to produce economically. Many furnaces which might be rated as fairly modern would need many months to get into shape, while others would find it difficult to secure fuel or supplies of Ore for a long time.

The possibility of a shortage of furnace capacity during the current year is by no means a visionary dream. It is a contingency which the trade must keep in view. We know of instances in which it is a factor in determining purchases of metal now.

In the Steel trade there has been only a moderate movement. In Pig Iron the event of the past ten days has been the sale of about 60,000 tons of Bessemer Pig for the second quarter at $9.50, Cleveland. Southern Pig Iron producers have effected considerable sales in the West and the market is steadier.

In Finished Material the sales have been rather light.

Pig Iron.—Some pretty good sales have been made during the current week in the New York market, but the movement is not heavy. Some brands of Northern Irons are being offered for delivery during the greater part of the year at prices as low as were made last year. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

The Philadelphia Pig Iron market cannot be called active, neither can prices be called strong. In some cases they are steady, but there are not many sellers but would shade a trifle to secure orders from good customers. A more lively movement is liable to set in at any time, and although we repeat the old quotations, some brands can be had at 25c. less money, but a good deal depends on circumstances. General quotations are about as follows, subject to the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; Plain, $10.75 to $11.

The past week was quite active in Chicago, both with local producers and Southern sales agents. Large consumers who still have Iron due them on contracts are buying for delivery further ahead. The general trade are also buying quite liberally for their future requirements. A most interesting development of the past few days is the withdrawal of extreme low prices by Southern sellers. The Southern sales agents report the week as the best they have had for several months. Nothing new occurred in Lake Superior Charcoal, although it is reported that a little larger business has been done. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.65 to 11.00
Southern Coke, No. 3	10.10 to 10.60
Southern, No. 1 Soft	10.75 to 11.25
Southern, No. 2 Soft	10.35 to 11.00

Foundry Irons continue quiet in the Pittsburgh district. We quote. f.o.b. Pittsburgh: No. 1 Foundry, $10.50 to $10.75; No. 2 Foundry, $10 to $10.25; Bessemer, $9.90 to $10.15.

In the Cincinnati district, business in Southern Pig Iron has been somewhat better during the past week than for any week within the past two months. The market is unquestionably steadier and but little complaint is heard of price cutting; the volume of inquiry is quite large; and a very fair business is being booked, mainly made up of orders for less than 500 tons, many of which come from parties who are also asking for terms on much larger lots. All signs seem to point to a heavy business at no distant day, and the feeling is that it will not take much buying to bring about a 25c. advance on present prices. Northern Irons are in the main in sympathy with the market for Southern stock, although there are some complaints that here and there prices have been and are being cut as much as 35c. below Southern lists. Some Ohio Iron is being offered very low. Quotations are as follows, f.o.b. Cincinnati :

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to ....
Southern Coke, No. 3	9.00 to ....
Southern Coke, No. 1 Soft	9.75 to ....
Southern Coke, No. 2 Soft	9.50 to ....
Southern Coke, Gray Forge	9.00 to ....
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to $13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The Pig Iron market in St. Louis has not shown any material change during the past week. The situation is generally regarded as being strong and the prices quoted below are believed to be about as low as furnaces are inclined to quote, and these prices are only for delivery during the next 60 days. For Iron required later than February higher prices are quoted. With no accumulation of stocks in either buyers' or sellers' hands it will be hardly possible for any material increase in the demand to take place without advancing prices. We quote as follows for cash, f.o.b. cars St. Louis :

Southern, No. 1 Foundry	$10.25 to $10.75
Southern, No. 2 Foundry	10.00 to 10.25
Southern, No. 3 Foundry	9.75 to 10.00
No. 1 Soft	10.00 to 10.25
No. 2 Soft	9.75 to 10.00

TRADE REPORT.

METAL MARKET.

Pig Tin.—Wholesale prices have advanced under the influence of good trade demand and moderate importations. Quite firm tone to advices from London has also helped to stiffen the market in some degree. There has been quite the average buying for consumptive wants and by jobbers, but speculative interest here remains dull and flat, in the absence of any incentive to operations in forward deliveries. Jobbers quote small lots of Straits Pig from store at 4½c. per lb.

Copper.—Exporters continue to buy very fairly in a quiet way, but home consumers' purchases are moderate and almost invariably for early delivery. The outward movement to all appearances still takes up enough of current production to prevent any burdensome accumulation, and prices are holding very steady both for wholesale and retail lots. Dealers' prices for small lots from store remain at about 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—There has been more inquiry for manufactured Copper, especially from the cornice making trade. The large number of important business and other buildings now going up in this city and vicinity call for a considerable quantity of Sheet Copper in their construction, and a large demand is expected to be developed as the year advances and the new structures progress toward completion. Meanwhile the current demand is not yet of large proportions, although orders showed some improvement over last week. Small lots of Sheet Copper from stock are quoted by retailers on the basis of 15c. per lb., a figure which does not prevail universally, however, although the tone of the material is firmer.

Pig Lead.—The demand from all quarters has been moderate, and deals involving more than a few carloads, mostly for early delivery, were strictly the exception. Wholesale prices have ruled very steady, however, in the absence of any disturbing influence. Jobbing orders have been limited to small lots for present use, which are quoted by jobbers at 4⅛c. per lb. for American Pig.

St. Louis advices report a dull market in Pig Lead, sellers quoting a higher rate than consumers are willing to pay.

Spelter.—The market remains in a flat condition with prices at last week's level. Retail quotations for good Western brands in small lots are at 4.40c. to 4.50 per lb.

St. Louis advices are as follows: Notwithstanding the continued effort made in certain directions to advance the market for Spelter there are plenty of producers who seem satisfied with the prices ruling to-day and do not consider the conditions justify any advance at this time. The demand is fairly strong.

Antimony.—Sales are running very fair, and prices remain steady at about 7¼c. for Japanese, 7½c. for Hallett's and 8½c. for Cookson's in small parcels from store.

Nickel.—The market is steady at 38c. per lb. for small lots.

Aluminum.—A fair demand is reported, with no change in prices, which are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c per lb.; 100-lb. lots, 30c.

Tin Plate.—American Coke Plates were selling early in the week in a fairly liberal way for delivery extending over March and April, but the business in this direction fell off within the last day or two to very moderate proportions. A more or less keen competition for orders is noted, and while spot prices are fairly firm it is understood that offerings of Plates other than special shapes for forward shipment were made at the lowest prices of the year. The market is in a by no means satisfactory condition just at present. Many large buyers seem impressed with the idea that they will be able to secure more favorable rates by holding off their orders until later on, and some of the mills seem to be getting hungry for business, with the result of a weak and unsettled feeling in the market, at least so far as large business is concerned. The meeting of the Committee of Tin Plate Makers in Pittsburgh last week does not seem to have resulted in anything definite, but efforts to bring the mills together are still being actively carried on. The small trade in this section was more brisk during the past week, with a fairly large run of orders for material required for present use. Stocks everywhere are believed to be light. Jobbers' prices for small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but these rates are not infrequently shaded: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates, aside from a few specialties, are in extremely limited demand and prices remain largely nominal.

Sheet Iron.—There is a large volume of inquiry, which indicates a probable heavy demand for Black Sheets in the early future. Makers, however, are generally disinclined to book orders for future delivery except at an advance over current rates, while consumers are unwilling as yet to bid up to their level. It is understood that several important contracts are pending which involve deliveries covering the entire year. Comparatively active business has been transacted during the week in Black Sheets for prompt delivery, and a few good sized orders were placed covering the first quarter of the year. Prices meanwhile are somewhat irregular. Jobbers have experienced a fairly good demand from the smaller class of consumers for both Black and Galvanized Sheets, but the prices at which their sales were made were almost invariably low. Small lots from stock are quoted at about 2.35c. to 2.40c. for No. 27 Common Black Sheets, and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: A very good business is being done in both Black and Galvanized Sheets, not only in carload lots for early shipment but in the replacing of contracts for spring delivery. Few if any manufacturers are willing to take orders now for delivery beyond April. Buyers, however, are asking prices on summer delivery and are anxious to close. Small lots from stock are selling at 2.20c. to 2.25c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—A better demand is noted for Old Brass for export, and also for Zinc; but the general market is somewhat unsettled, with a comparatively tame demand. Holders, however, have confidence in a better demand and prices before long, and are not pressing sales Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10 50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	4.50

The annual report of the New York State Board of Railroad Commissioners, presented to the Legislature at its meeting last week, says: "Physically, the railroads of New York State are in good condition, the trunk lines particularly so, both in the matter of roadbed and structures. The increase in gross earnings during 1896, amounting to nearly $11,000,000, was practically all expended in renewals. The roads were in consequence in better condition than at any time since the effect of business stagnation upon railroad earnings was made manifest. The figures show a loss in gross earnings of nearly $6,000,000 as compared with 1896, but a considerable increase over the years 1894 and 1895."

A monster iron curtain, the largest of its kind in the world, has just been completed for Olympia, a large London amusement palace. It is 240 feet long and 45 feet high.

CHICAGO REPORT.

Scrap.—Considerably more business is being done, but prices are no higher. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—The demand is very light. The ruling prices of carload lots of 12 tons minimum are as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	7.00	7.25
Council Bluffs, Iowa	7.00	7.25
Lincoln, Neb	7.15	7.40
Sioux City, Iowa	7.50	7.75
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.65
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.00	7.25
Davenport, Iowa	6.30	6.65
St. Joseph, Mo	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb	7.00	7.25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

The hopeful feeling which prevails in trade circles is a conspicuous feature of the situation. The business and financial conditions are regarded as specially favorable for trade in the near future and business is apparently beginning to show a perceptible improvement. Since the opening of the year, while it is too early yet to expect a heavy demand, there is an evidently hopeful tone and an encouraging volume. The trade, while still conservative and deterred by the caution which has been rendered habitual during the long continued depression, report improved conditions in their several localities and are replenishing their stocks with more freedom. Travelers are beginning to go out, and in a short time the trade will doubtless show the results of their activity. Prices are without important change. The steadiness in general which has characterized the market during the dull months and the advances, though comparatively few in number, which have taken place are regarded as excellent indications.

Advices from Chicago.—All the travelers connected with the local Shelf Hardware houses are not yet on the road, but will be this week, after which a much better idea can be formed as to what the new year has in store. The demand so far as it has been measured by the trade in progress has been particularly good, much better than usually seen so early in January. The weather for the past week has been remarkably mild, which would not seem to be conducive to trade. Despite this apparently unfavorable condition mail orders have been coming in freely. The Heavy Hardware trade is in extremely good condition, consumers purchasing very liberally. The outlook was never brighter. The railroads are especially large customers at present.

Advices from St. Louis.—The new year has opened very auspiciously for the Hardware trade. With only a third of the month gone the orders already received, both by mail and direct from traveling men, indicate that the present month will be a very satisfactory one. The demand for shelf goods has been particularly heavy, and in the way of Tinware and House Furnishing Goods generally the demand has exceeded general expectations. Hardware dealers are ordering very liberally and report trade with them as being exceptionally good. The farmer is commencing to spend some of his earnings of last year and the country Hardware dealer is beginning to feel the effect of this increased trade. The favorable feature of this improvement in trade is that it is nearly all cash business, thus enabling the dealer to discount his bills, which in many sections he has been unable to do for several years past. The general tone of prices is strong, and where advances have been made it is pleasant to note that they are being maintained. An instance of this kind is Screws, which are being firmly maintained at the recent advance. The general conditions governing the Hardware trade are satisfactory, and the jobbing trade are a unit in anticipating a large and profitable spring trade.

NOTES ON PRICES.

Wire Nails.—The past week has witnessed some increase in the demand for Wire Nails, but the trade are not disposed to purchase in a speculative way at present prices. A good many orders for moderate quantities are, however, being received by the manufacturers, who are now accepting orders for delivery during next month, refusing to make contracts for execution later in the season. Those interested in the consolidation of Wire interests are still working in this direction, their attention being given to valuation of plants, a work requiring much labor and time.

Advices from Chicago.—The conditions of trade for the past two months have been very different from what they usually are at this season. It generally happens that during these two months business is extremely dull and prices drop to a very low point, but this year the prospect of the consolidation of Wire Rod interests has braced up the market and manufacturers will consequently go into the spring with large orders booked at satisfactory rates. Jobbers have not advanced their quotations to correspond exactly with those made by manufacturers and quote small lots from stock at $1.60 and carloads $1.55.

Advices from St. Louis.—The improvement noted in our last issue continues to dominate this department. The feeling is gaining ground daily that the Wire combination is assured, and that in consequence prices must of necessity be advanced. Jobbers report an excellent trade, and quote $1.65 to $1.70, base, for small lots from store.

Cut Nails.—With the resumption of business after the holiday season there is a somewhat increased demand for Cut Nails, but the amount is moderate and the market only fairly steady.

Advices from Chicago.—A light movement is reported in Cut Nails, with prices of small lots unchanged at $1.45.

Advices from St. Louis.—The improvement in Wire Nails has not as yet had any effect on Cut Nails, which continue to be quoted as heretofore. Jobbers ask $1.45 to $1.50, base, for small lots from store.

Barb Wire.—The manufacturers of Barb Wire are confident of a large business during the coming season, and prices are firmly maintained.

Advices from Chicago.—A very good business is reported by manufacturers, who are now well sold up for January and beginning to book orders for February delivery. Jobbers' prices are unchanged at $1.60 for Painted and $1.90 for Galvanized.

Advices from St. Louis.—The demand for Barb Wire is unusually heavy, and it has made its appearance earlier than the trade anticipated. With no large stocks in either the factories or with jobbers an advance in price is not surprising. Jobbers report a heavy trade, and quote Painted at $1.70, with 30 cents per hundredweight advance for Galvanized.

Smooth Wire.—The market in Smooth Wire is without change. There is a larger volume of business, and the market is firm.

Glass.—A large proportion of the Window Glass factories went into operation on January 8 and new Glass is expected to be in market by the last of the month. The policy of the American Glass Company, as outlined by reports, is to be a more liberal one to the jobbers than that pursued by the agencies last year. The jobbers, according to reports, are to be considered the best fitted to handle their own trade, so that the company will solicit business only from jobbers. It is understood that the

market will be kept for domestic Glass and that every effort will be made to supplant the imported article. The American Company consider the average advance of the new price-list and discounts to be about 7½ per cent. over the prices ruling in July, 1897, previous to the recent inflated prices. The advance is referred to as giving in the East an average advance of about 5 per cent. and in the West an average advance of about 10 per cent., the list of the first brackets having been increased, while the increase shades off as the sizes advance.

White Lead.—Orders are being placed somewhat more freely for Dry Lead for delivery in the immediate future, and to all accounts quite as liberally as usual at this period of the year. The distribution of Lead in Oil is also meeting expectations and seems to be helped along by the strong position of the market for Linseed Oil. The latter article is not as high in price as the position of raw material would seem to warrant, but offers are more reserved and not without indications that both Eastern and competing producers are at present more inclined to go slow than to be vigorously aggressive. Pig Lead, however, is not as strong in price as market conditions would seem to warrant, and that fact evidently has a restraining influence.

Red Lead.—There has been quite the average business in Red Lead, but dealings were of ordinary character and at virtually the prices that have been quoted for a considerable time past.

Linseed Oil.—The course of the market for raw material has been decidedly upward. Prices, in fact, have reached the highest point of the season. Oil sympathized in superficial way only, however, although relatively much the lowest, but city crushers are more reserved in their offerings and out of town competition has minimized in no uncertain way.

Spirits Turpentine.—In sympathy with higher cost at the South wholesale prices here have moved up, and the market is very firm at the advance. Consumers and jobbers purchased fairly, but speculative operations were largely accountable for the advance.

Old Rags, Paper, &c.—The market for Paper Stock has been quiet, with prices unchanged, but generally firm. Dealers are paying about the following rates for New York City delivery:

No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅝c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c.
Light Book Shavings	per lb.	½ to ¾c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 3/5c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅜ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅜ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Old Rubber.—A fair demand is noted and prices show no quotable change. Local dealers are paying about the following figures :

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

Major Leach of the United States Engineer Department has prepared a report upon the proposed improvement of the Connecticut River so as to render it navigable to Holyoke, in which he declares the scheme to be perfectly practicable and worth undertaking. The estimated cost of the improvement, which would involve three locks and movable dams, is $2,000,000. The saving in freight rates and the increase in traffic secured would, he believes, soon pay a return on several times that sum.

A press dispatch from Halifax, Nova Scotia, asserts that a second Klondike has been discovered in Labrador by representatives of an American and Canadian company, who went there for the purpose of erecting saw mills. They report that gold deposits of great richness exist in Labrador. Arrangements are being made for an expedition of prospectors to that country in the spring.

The figures of ocean travel for 1897, just compiled by Wm. C. Moore, landing agent at the port of New York, show a decided falling off in the transatlantic passenger business last year as compared with 1896. The number of cabin passengers landed was 90,932, and steerage 192,004, as compared with 99,223 and 252,350 respectively in 1896, although the number of trips increased from 852 in 1896 to 901 last year.

Manufacturers.

Active, progressive American, 41, with 20 years' experience as a local and traveling salesman and sales agent of a corporation in this city, whose business is with stove manufacturers, jobbers and retailers of stoves, hardware, tin and plumbing goods; large acquaintance with buyers East of Chicago and Pittsburgh; thoroughly conversant with modern business methods, management of salesmen, &c., in every way capable of filling responsible position, is open for an engagement here or elsewhere as manager or similar capacity in which this experience can be utilized; clean record; high credentials. Address "A. B. C.," office of *The Metal Worker*, 232-238 William St., New York.

$1,000.00 will purchase machines, stock and good will of an established Slate, Tin and Iron Roofing and Cornice Business in a town of seven thousand inhabitants in Southern Illinois. There is no one else in the same line of business in the town. There is a very large population in the surrounding country and the opportunity to purchase an established and profitable business is exceptional.

Address "ROOFING," office of *The Metal Worker*, 232-238 William Street, New York.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice,** or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"
office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

YOUR CHANCE.

Plumbing, Heating and Light Hardware business for sale, with no competition in the hardware line. Well established and a rare opportunity for any one having a limited capital to make a start. Address

"YOUR CHANCE,"
office of *The Metal Worker*, 232-238 William St., New York.

Register For Sale.

The patentee of a new Improved Dustless Register wants to either sell same or interest manufacturers who can make same. This register can be manufactured 8 to 10% less than any other register on the market and has strong selling points over any other.

A. L. CANFIELD,
284 Pearl Street, New York.

OWING to the death of the proprietor, a Stove, Heating, Plumbing and House Furnishing business is offered for sale, in Claremont, N. H. A growing manufacturing town of over six thousand inhabitants. This is a first-class opportunity for any one wishing to engage in this business.

A. C. STONE, Administrator,
Claremont, N. H.

FOR SALE.

A good clean, well assorted stock of Hardware, with Plumbing and Tin Shop connected and commanding the best trade in town. Competition consists of one other hardware store. Located in Central New York State in a town of about 7500 inhabitants, having the trunk lines of railroad, paved streets, electric lights, electric street cars, water works, good schools, etc. Stock and fixtures will invoice between $7000 and $8000. Annual sales average about $25,000. This is a rare chance for a cash buyer. Address "RARE CHANCE," office of *The Metal Worker*, 232-238 William St., N. Y.

Special Notices.

THIS volume has been compiled from the extended series of articles in *The Iron Age*, on the arrangement of Hardware Stores, and contains a large and varied mass of information in regard to store arrangement.

A chapter is devoted to each subject and all are fully illustrated.

The summary of contents will convey an idea of the wide scope of the work, which treats of almost every subject connected with the arrangement of Hardware Stores.

Every hardware merchant should have a copy.

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

Sent, post-paid, upon receipt of price, by

☞ SEND FOR ILLUSTRATED CIRCULAR.

—"WELL, my son," said the Editor of "The Danville Breeze," to his son, who wanted a wheel, "you'll find one in the front end of that wheelbarrow, and there is a big pile of coal ashes back of the house that will have to be moved. The handle-bars are of white ash and are adjustable, so you can get any style of hump or that suits your fancy. It is regulated largely by the load you put on. The bigger the load the more you have to hump yourself. Be careful and don't mar the enamel on the frame, and keep the ball-bearings well oiled, so they won't cut into the cones. The tire is absolutely punctureless, so you won't have to take a pump and repair kit with you. By the time you have removed that pile of ashes I think you will have made a century run, also the perspiration. You'd better come in to dinner now."

—COLLAR BUTTON A GOOD PILL.—A Shelbina newspaper man bought two pills and put them in his vest pocket. He also bought a pearl collar button and put it in the same pocket. When it came time to take a pill he shut his eyes, opened his mouth and gulped it down. He was relieved of his headache and went on his way rejoicing. Afterward, having use for the collar button, he felt in his pocket and found two pills and no collar button.—*Kansas City Journal.*

"Traps"

to catch the unwary are commonly met with in the business world in all classes of trade. It's a disagreeable duty on the part of honest traders to expose pitfalls. It becomes our duty to caution the trade against tin plates represented to be made from charcoal iron, the boxes containing which are not branded GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES. There is only one concern in the world now making charcoal plates from Swedish iron bars, hammered out in the good old fashioned way, and hand dipped, and we control their output for this country under our brand name. These are the plates such as were made in the times of your grandfathers, and the method employed in their manufacture to-day is precisely the same as then. *THESE PLATES HAVE NEITHER "SUPERIOR" NOR "EQUAL,"* and their genuineness may be determined by seeing that the name "GUMMEY" is branded on every box.

GUMMEY, McFARLAND & CO., Philadelphia.

—FIXED IN HIS MEMORY.—"I should say I do remember it," said the fat man, who was asked if he recalled a certain railway accident. "Williams—you remember him?—was sitting in the seat ahead of me, and was instantly killed, poor fellow! And that isn't all. He was telling one of the funniest stories I ever heard, and though I have tried ever since to find what the end of that story was, I never have been able to run across any one who knew."—*From an Exchange.*

PLEASED WITH OUR.. PATENT EDGE

THE CINCINNATI CORRUGATING CO., Box 314, Piqua, Ohio.

Dear Sirs :—I received the Patent Edge Corrugated Iron Roofing yesterday which I ordered from you on the 2nd inst., and must say that I am exceedingly pleased with the Roofing. I find it to be just as you represented it, and believe it to be cheaper than other Corrugated Roofing I have been buying at seemingly lower prices. I find your Roofing to be heavier than other roofing I have been buying and in all am well pleased. Thanking you for your promptness in shipping this order, and trusting that my future orders will receive the same prompt attention and goods equal those just received, I am,

Yours very truly, *JAS. N. ANDERSON.*

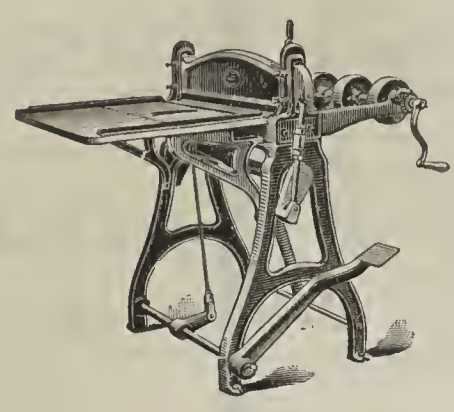
SYKES IRON & STEEL ROOFING CO., - Chicago and Niles, O.

NIAGARA STAMPING & TOOL CO., = Buffalo, N. Y.



MANUFACTURERS OF

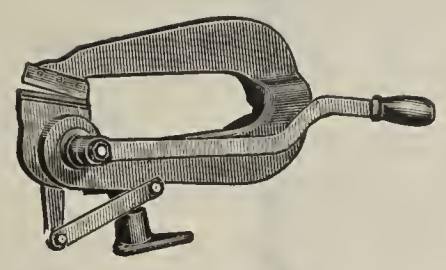
Tinsmiths' and Roofers' Tools, Shears, Presses, Dies, and Special Machinery for Sheet Metal Work.

NIAGARA ROOFING DOUBLE SEAMERS.

For double seaming standing seams of sheet metal roofs without using a mallet. The construction is simple and durable, all parts made of malleable iron. One of the seamers does the bending, the other the squeezing. Both are quickly adjustable for the first and second bends. The edges are securely clamped while being turned over. All the work is done by means of the foot treadle. The handles are used to clamp the edges, and they give a firm support to the operator. Suitable for I C as well as I X tin without adjustment.

NIAGARA CROSS LOCK SEAMER.

For compressing the cross seam of roofing sheets and rolling up the connected sheets. It is simple, rapid, and easy to operate. Working length, 28 inches.



The seam produced is perfectly tight and uniform the entire length.

Side gauges are provided on the drop table, and the sheet is held in proper position between the bar and bed by means of hinged fingers fastened to the pressing bar. These fingers move out of the way automatically when the bar is being depressed, and they drop down again when the bar goes up.

An eccentric attachment is applied to the pressing bar to raise the same sufficiently to allow the folded edge of the first sheet to pass through.

Easy to handle, no experience required.

Common gauge for 3-4 in. seam, wide gauge for 1 inch seam.

NIAGARA SCROLL SHEARS.

For cutting ovals, ogees, irregular shapes and patterns of all kinds. Distance from knives to frame, 11½ in. Upper knife 4 in. long. Capacity, No. 20 iron or brass.

Send for Catalogue, free.

The Poorman Manf'g Co.,

PIQUA, O.

—HE PROVED HIS CASE.—"Human nature is mighty queer, isn't it?" he observed to the other man on the rear platform of the street car.

"Yes, I suppose so," replied the other.

"People are too sensitive—altogether too sensitive."

"I dont know about that."

"Well, I do. For instance, now, you have a red nose. You are to blame for it, perhaps, but you are so sensitive that if I should offer you a remedy for it you———"

"You old loafer, I've a good mind to knock your head off," hissed the red nosed man as he squared off.

"Told you so!" replied the other as he dropped off. "Human nature is the queerest thing on earth, and some folks are so sensitive that they'd swallow their false teeth rather than let any one know they had 'em.—*Exchange.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

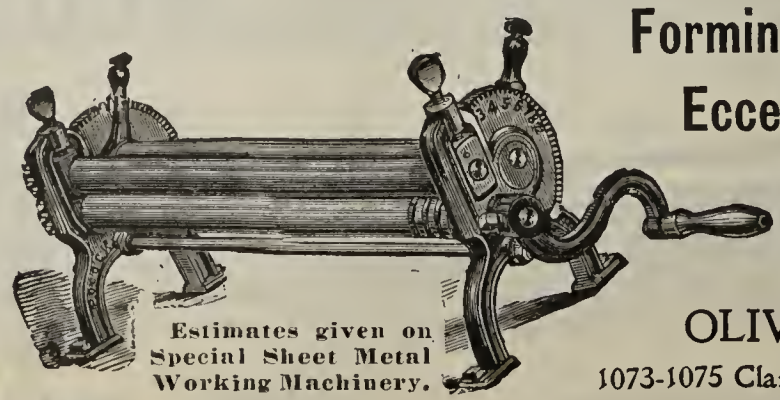
MINNEAPOLIS, MINN., Dec. 9th.

DOUBLE TRUSS CORNICE BRAKE CO.,
BUFFALO, N. Y.



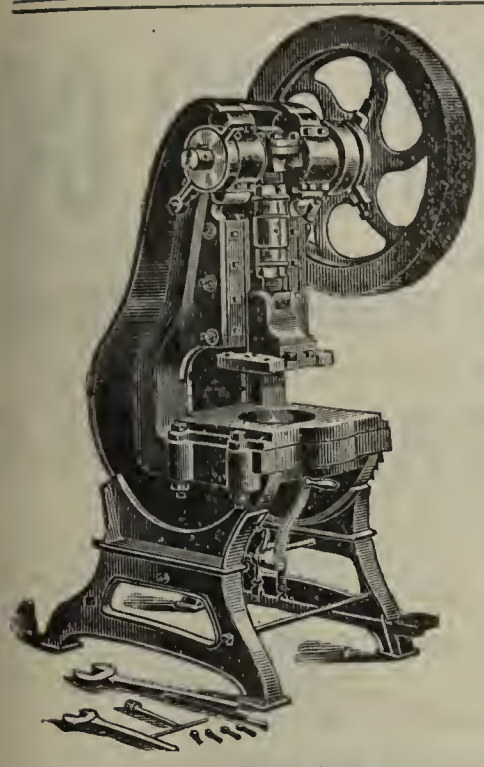
Gentlemen:—Enclosed please find N. Y. Exchange for $—— to pay for Cornice Brake sent us about six weeks ago. We never paid a bill for tools where we thought we came as near getting our money's worth as we do in paying you for this Brake. The machine is all right, and all you claim for it.

The Brake is now in a distant part of this state where our men are putting in a job of large square galv. piping. Should it get in a wreck and be lost to us, we would order another just like it at once.

All the boys in the shop are anxious to know when that Brake is coming back. For our use we would rather have this than an iron one. We are, Very respectfully yours, LUCAS BROTHERS.

All Sizes from 3 ft. to 10 ft. Indispensable to Cornice makers, roofers, tinsmiths, furnace men, etc.
Send for our latest prices.

THE DOUBLE TRUSS CORNICE BRAKE CO., 259 Grant St., Buffalo, N. Y.



Estimates given on Special Sheet Metal Working Machinery.

Forming Rolls, Eccentric Adjustment.

The advantage in using this machine is the quick adjustment of the back roll by means of graduated eccentrics.

—MAX BLEIMAN was in the city yesterday. Mr. Bleiman is summering on his place down on the Rumsen road in New Jersey. He has a new story to tell about the Jersey mosquito. He has no mosquitoes on his place—did you ever meet any inhabitant of Jersey who did?—but a few miles away there are some of a particularly virile breed.

"Now, you won't believe me, I know," said Mr. Bleiman, "but I give you my word it's a fact. A man was bitten by a snake in the woods, and he laid down to die, but after a while he came to life again, and found more than a bushel of dead mosquitoes near him. The mosquitoes had bitten him and drawn all the snake poison out of his blood. I saw some of the mosquitoes myself."—*Evening Telegram.*

EXCELSIOR STRAIGHT-WAY BACK PRESSURE VALVE

This valve has no dash pots, springs, guides or complicated levers to get out of order. It is simple, reliable and well made. Never sticks, and can be relied upon at all times when using exhaust steam for heating; or when used as a relief, or free exhaust on a condensing plant, it has no equal. It is noiseless and free from any complicated attachments.

HATBORO, PA., Dec. 26th, 1896.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR :
In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal
Very truly,
I. N. EVANS.

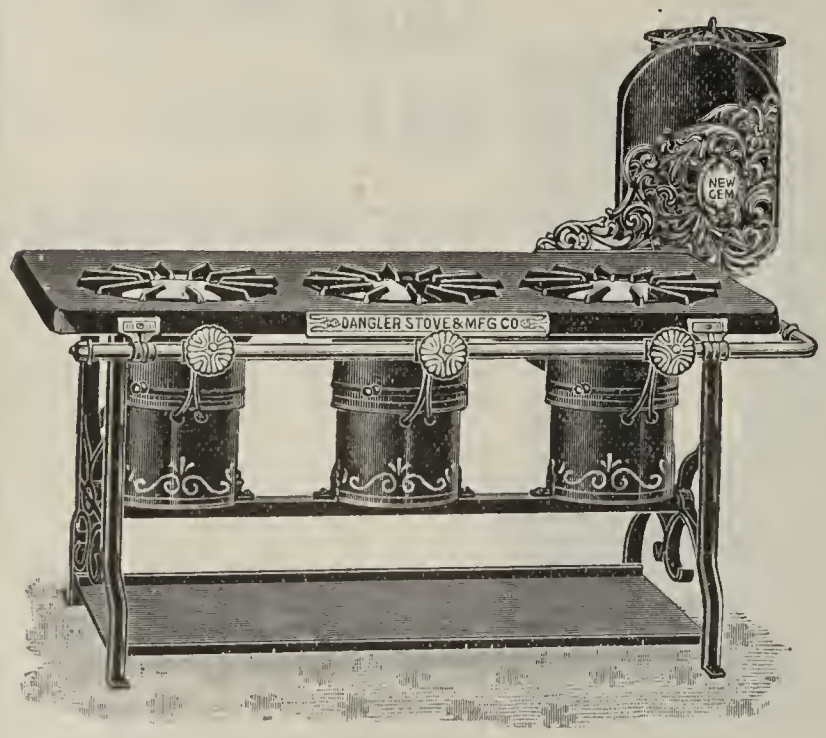
BLUE FLAME OIL STOVE LEADERS

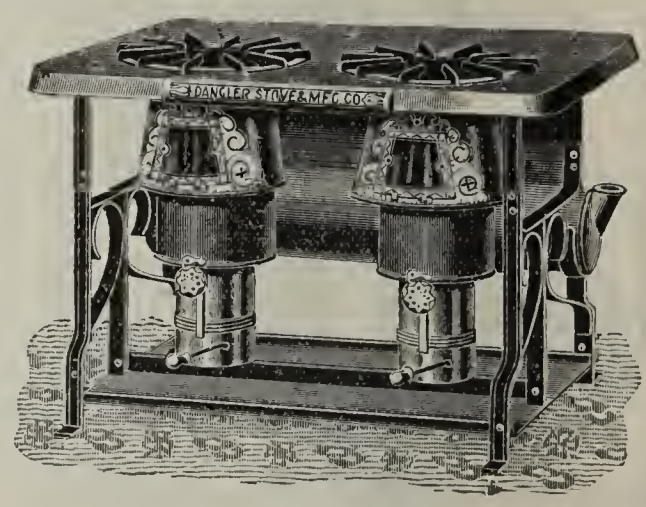
FOR 1898.

WE LEAD AND OTHERS FOLLOW.

For Durability and Simplicity our Blue Flame Wick and Wickless Stoves are recognized as the best in the market.



WICKLESS.



Made in seven different styles. Convenient in construction; economical in the consumption of oil; made with our Double Feed; German Silver points; no rusting or clogging; with valve-stop and regulator; heavy brass chimneys. Made for service and not for show. High back swinging shelf; removable tank; stove on rollers; easy to operate and to clean.

A STOVE FOR THE PEOPLE.

WICK.

Our celebrated Blue Flame Wick Stoves are made in seven different styles, and are now in use in more than fifty thousand households in the United States, who bear willing testimony to their great merits. Artistic in design, handsome in appearance, and powerful in operation.

Our line of Gasoline Vapor and Evaporating Ranges, Stoves, etc., as usual. is perfect and complete. Send for Catalogue.

DO NOT SPECULATE

IN

Cheap or Experimental

LINES OF

Vapor or Oil Cooking Stoves.

The average mortal has troubles enough of his own without buying those of his neighbor.

Speculation in any of the above mentioned lines will drain your purse and put you to a world of trouble.

Seeds of prudence now well sown in the selection of a line that is both complete and honest will yield a profitable and happy harvest. A good beginning for 1898 means half the battle won.

If you are interested in the handsomest line made, write for our catalogue.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.
Price, $1.00.

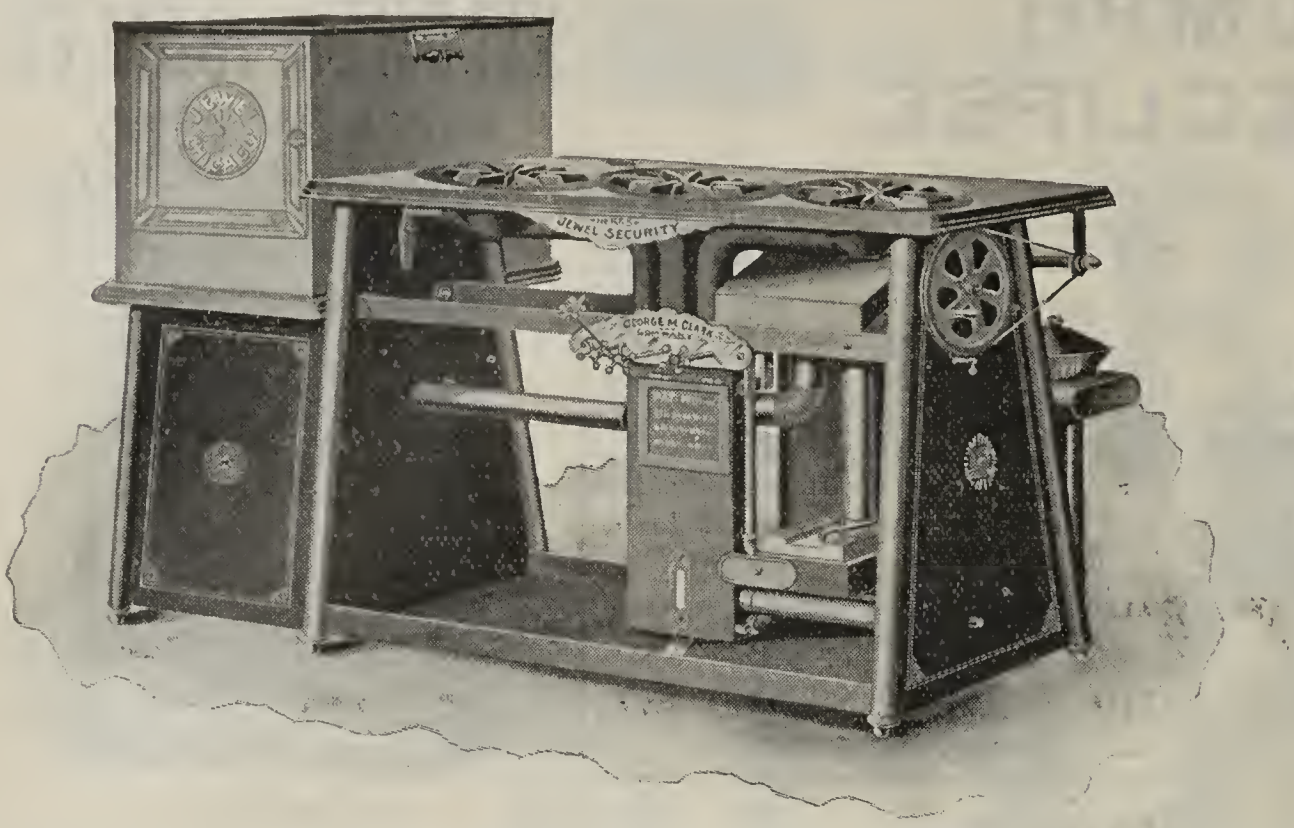
The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*



The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

HIGH GRADE HEATERS.

ANYTHING

that will hold a fire can be called a furnace, and to inexperienced persons may pass as a furnace.

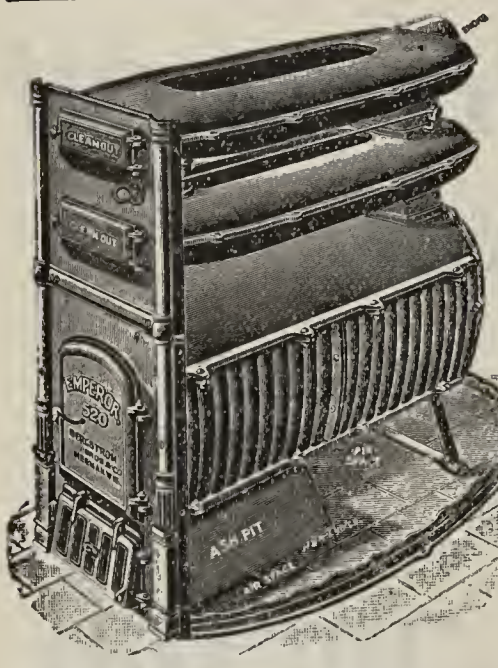
ACTUAL

use will quickly demonstrate, however, whether brains have been used in constructing a furnace so that it well deserves the name. An experience of many years has shown wherein other furnaces have

FAILED

to fill the requirements for burning soft coal, and in the furnace illustrated here we have secured features that have rendered the burning of soft coal a certainty. It uses this fuel without

SMOKE SMELL.



and without damage to the castings. With this furnace soft coal can be used with as little discomfort as if hard coal were used.

OUR CATALOG

explains more fully, and dealers who want to develop a good business this year in soft coal sections can render their success certain by handling this furnace.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.

KEEP YOUR HANDS CLEAN.

THE PARKS STOVE POLISHING MITTEN AND DAUBER

Is a great improvement over the old stove brush for blacking stoves, **without getting a speck of blacking on hands.** The front is soft, durable sheepskin, with the wool on. The back is waterproof cloth.

The Dauber is also made of sheepskin, with the wool on, and so shaped as to readily get the blacking into all crevices and corners. It is also adapted to polish russet and patent leather shoes, cleaning windows, furniture, etc.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

"The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

The Climax Ratchet Stock.

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

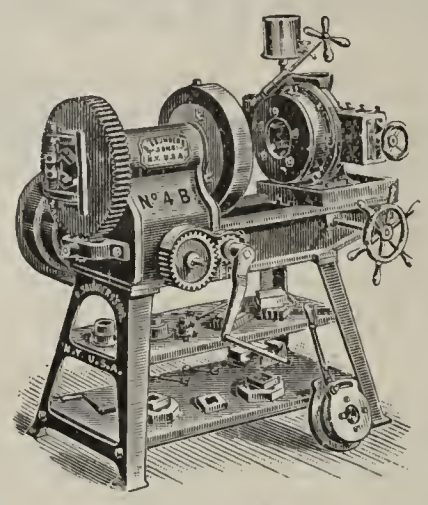
The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.



SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

Box 224. J. S. SHERMAN, Cassopolis, Mich.

—FUN WITH THE CAMERA MAN.—A professional photographer tells a tale of a practical joke. One day a young man came to sit for his likeness. To the ordinary eye he looked just like any other young man. A couple of plates were exposed, and then the assistant, who was operating, went into the dark room to develop the negative. He was gone much longer than usual and was heard berating the junior assistant pretty soundly for playing pranks with the apparatus. When he returned to the studio he asked for another sitting and apologized for having before used spoiled plates. This time when he went away to develop he was heard to utter a slight scream, but he reappeared and said there was a peculiar effect in the negatives, which he couldn't account for, and would the sitter oblige him again.

Once more he went to develop; then the bell rang violently for the master, and the two held a long confabulation in the dark room together. This done the master tried his hand and went away to develop. It was not long before he returned and said he was sorry not to be able to get a satisfactory likeness, but a skull and crossbone appeared defined on the young man's forehead.

"Rubbish!" said the sitter; "my forehead's all right. Can you see anything the matter with my forehead?" and he peered into the mirror as he spoke.

"No, there's nothing that I can see," answered the photographer. "But I should be obliged if you will please go away and not come here again; this sort of thing is just a wee bit creepy."

Upon this there was a dreadful scene, but the upshot was that the young man had to go, and up to the present time has never returned.

The explanation of the matter is that the young man was a bit of a scientist, and had been playing a joke on the photographer. Bisulphate of quinine is a chemical which is white to the naked eye, but seen black by the camera. Anything that is painted on the skin, therefore, with the chemical will be ordinarily invisible, but will come out prominently in a photograph.—*Pittsburg Dispatch.*

—A PROFESSOR of Trinity College, Dublin, overhearing an undergraduate making use of profane language, rushed at him frantically, exclaiming: "Are you aware, sir, that you are imperilling your immortal soul, and, what is worse, incurring a fine of five shillings?"—*Household Words.*

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

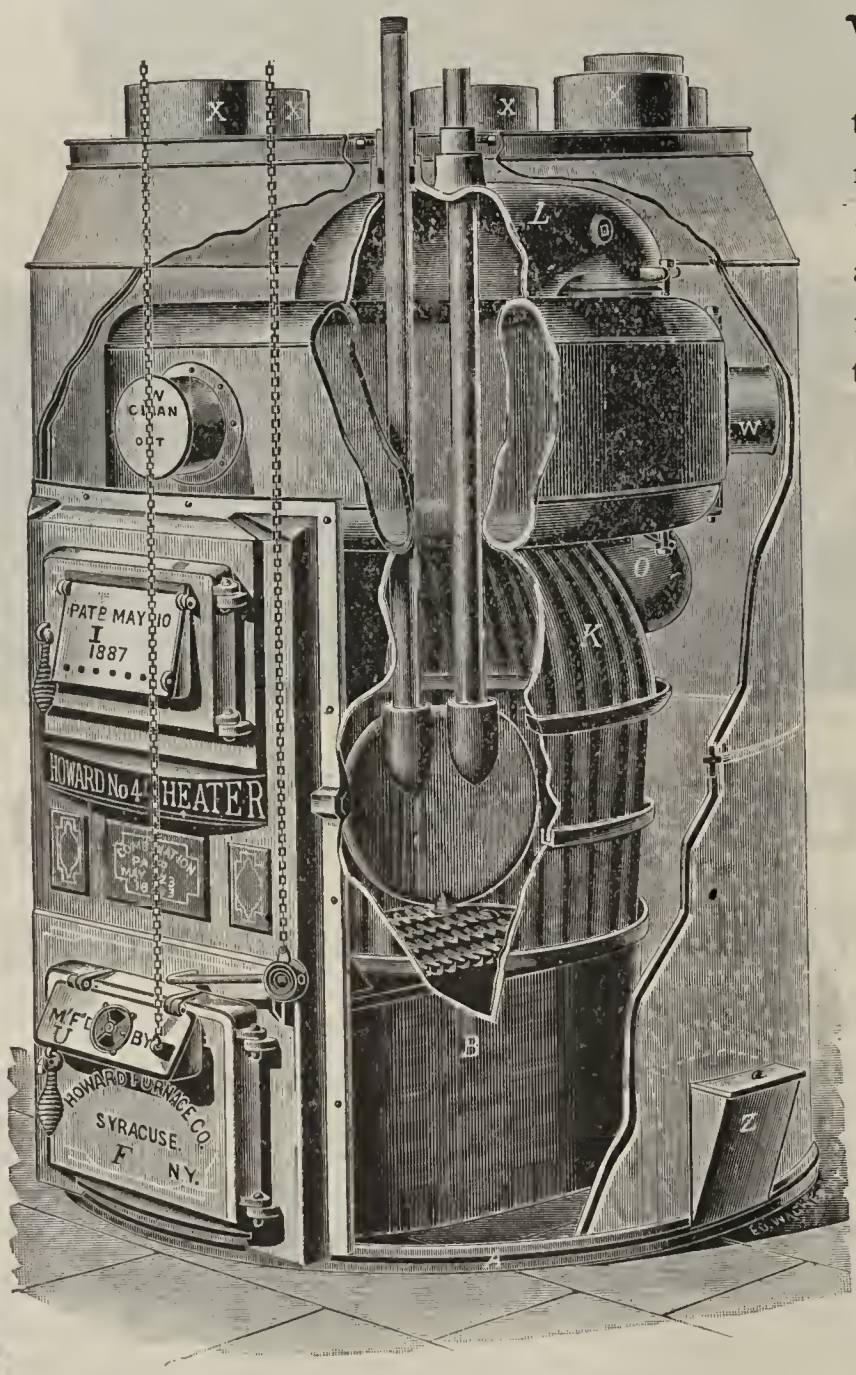
Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00.

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft.

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*



"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*

"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

DAVID WILLIAMS CO., Publishers, - 232-238 William St., N. Y.

limitation of effective heating.

When circumstances are such that pipes leading from a furnace are very long and level, the difficulty of conducting heated air through them renders the results meagre and unsatisfactory.

But with short pipes and a vertical delivery there is no system of heating so economical as the warm air furnace. There is a reason for the limitation of doing effective heating with heated air alone.

The power to move and deliver warm air from a furnace in any direction is simply ***gravity***. The factors are the elevation or height and the temperature of air in the pipes. It can therefore be readily understood that a long run of piping lessens the elevation, and curtails an upward flow of air, while the impelling force cannot be produced without a sacrifice of fuel and a severe strain on the heater by maintaining a high temperature of furnace plate. It is apparent that by combining air and water into a system of heating, a current of hot water can be made to do effective work under a slow fire without overheating the furnace castings. In this way a mild heat is at all times established. An apparatus embodying all the desirable features of hot water and air heating is here offered to the prospective buyer.

The Business Situation.

The main obstacle to general trade in the past week was the unseasonably mild weather which prevailed over a large section of the country and which naturally interfered with the demand for winter goods. Nevertheless the volume of business seems to have been large. Reports from the different trade centers indicate a much more active movement of business than is usual at this early period of the year. This activity is most pronounced in the Western and Southern States, where the demand for manufactured goods, particularly in the line of iron and steel products, is exceptionally lively for the season. Orders for spring trade so far received are encouraging, and indicate a fuller volume of business than has obtained since 1892. The tone of all the markets is cheerful, and prices, while showing no radical changes, are generally steady with an upward tendency in some directions. One favorable feature of the business situation is the resumption of wheat exports on a large scale, with indications of a steady call for the cereal abroad. The total of exports of wheat last week was 5,513,000 bushels, as against 3,481,000 bushels in the previous week, 3,948,000 bushels in the corresponding week of 1897, and 3,202,000 bushels in 1896. Exports of corn and cotton also continue heavy and are made at steady prices, while general exports of both agricultural and manufactured products fully maintain the high level established in 1897. Railway earnings make a most favorable showing. The increase of gross earnings in December was more than 13 per cent. over the previous year. The *Financial Chronicle's* tables for the last week of December show a gain of 14 per cent., and for the first week of January an increase of 18 per cent., while the gross earnings of railway mileage, aggregating 160,000 miles, was $59,000,000 better in 1897 than in 1896, the improvement being entirely in the latter half of the year. A disturbing feature is the serious strikes against wage reductions in the New England cotton industry, the outcome of which is as yet undeterminable. An unusual amount of business is being done in manufactured iron of all kinds, but prices are still low. The tremendous output of pig iron that is going on makes that product somewhat weak, but the largest branch of business in the finished iron trade, that of steel rails, is phenomenally active just now, with orders for about 1,200,000 tons of material on the books of the mills and more in prospect. The metal trade is generally quiet. Negotiations in progress aiming at a consolidation of the tin plate mills impart an unsettled tone to that market. A plethora of idle funds in the hands of local bankers induced a further weakening in loaning rates during the week, but more activity is noted in commercial loans than for some time past. There has been a reaction in the stock market due to disquieting rumors of the strength of the silver sentiment in Congress. Speculative and commission house transactions, however, were very large. Collections are generally referred to as satisfactory.

The Bicycle Here and Abroad.

The growth of the bicycle here and in Europe has been toward the same goal, but along lines totally dissimilar. In both parts of the world the endeavor has been to produce a machine of the greatest strength, rigidity, durability and efficiency, with the least possible weight of material. Of late years there has been no radical or wide departure change in the design, if we omit the chainless type, the differences being found principally in modifications and details. These distinctive characteristics appear in evidence only upon close examination, and while they are wonderfully apparent to the expert, and serve to distinguish one wheel from its neighbor, they may be easily overlooked by the novice. The American bicycle has made a deep and permanent inroad into Europe, particularly in the markets of England, France and Germany, and is selling largely and easily in direct competition with the home product. This superiority is due in the main to the elegant appearance, high finish, and to qualities conducive to durability and easy riding. All of these results are due, primarily, to the methods of manufacture here pursued, and which differ radically from those in vogue abroad. There the endeavor has been to adapt, without serious change, existing tools to the requirements of bicycle manufacture; here the bicycle is built with tools designed for that particular work, and intended to do nothing else. The consequence is that we here have special machines adapted to finish each and every part of the bicycle, and to produce work with the greatest rapidity and accuracy. The tool builders early appreciated the probable growth of the bicycle industry, and devoted themselves to the production of the essential tools required. The American policy of making a special tool for doing special work was in this instance followed rigorously. European bicycle manufacturers are grasping the advantages thus presented, and are adopting, as far as they can, American methods and tools. Unfortunately they cannot purchase with the tools the ingenuity which brought them into being nor the skill which may successfully alter them. The high excellence of the American bicycle is therefore due in a great degree to the tool designer, who has been so quick to supply the demands made upon him, and whose entire training permitted the perfect solution of the problem.—*The Iron Age.*

TIN PLATES.

TIN PLATE IMPORTS AND CONSUMPTION IN 1897.

The complete statistics of tin and terne plates shipped from Great Britain to the United States in the calendar year 1897, as furnished in the last returns of the British Board of Trade, show that this country took last year 85,475 tons of foreign plates, or 27,576 tons less than the total importations of 1896, being a decrease of nearly 25 per cent. The total amount of Welsh tin plate shipped here in 1896 was 113,051 tons; in 1895,222,901 tons; in 1894, 226,879 tons; in 1893, 255,628 tons; in 1892, 276,479 tons, and in 1891, 325,143 tons. The following table, which gives the monthly tin plate exports in tons from Great Britain to the United States for the past six years—that is, since the establishment of the domestic tin plate manufacturing industry—is interesting for purposes of comparison:

	1897.	1896.	1895.	1894.	1893.	1892.
January	8.810	11,861	18,626	18,296	23,498	17,554
February	9,678	6,980	23,201	13,413	20,190	22,268
March	10,358	8,903	18,743	16,907	31,334	22,789
April	8,146	10,903	15,946	13,210	31,651	31,061
May	6,916	9,222	18,118	21,291	26,988	23,799
June	7,172	11,753	13,760	17,247	26,759	23,550
July	5,484	13,930	16,445	17,805	22,248	24,750
August	3,526	8,814	23,531	19,125	15,784	24,221
September	4,656	7,167	17,507	17,672	13,789	22,535
October	5,036	10,599	19,805	24,854	13,861	19,901
November	5,570	5,840	16,186	22,382	15,495	20,634
December	10,123	7,079	21,033	24,677	14,031	23,417
Total	85,475	113,051	222,901	226,879	255,628	276,479

The figures above given are significant as marking a steady decline in the volume of foreign tin plate actually consumed within the United States until it has nearly reached the vanishing point. Dividing the 85,475 long tons of 2240 pounds imported last year into boxes of 108 pounds, the total receipts of Welsh plates in 1897 represented about 1,754,300 boxes. It is estimated by good authorities that the packing interests, such as the oil, dressed beef, fruit, vegetable and fish canners, use up in a fairly good year fully 1,500,000 boxes of tin plate in their export business, on which they recover the drawback of 99 per cent. Taking this figure, which probably represents fairly the volume of last year's re-exports of tin plate, the net consumption of the foreign product in this country in 1897 is seen to have been about 250,000 boxes, or less than the annual capacity of a single eight-mill works. It is conservatively estimated that the consumption of tin and terne plates in the United States last year, outside of the amount used for re-exporting purposes, was from 5,000 000 to 5,500,000 boxes. This would leave a balance of 4,750,000 to 5,250,000 boxes to be accounted for by the domestic mills.

Colonel Ayers' official figures of American black plate production, just published, gave 252,650,230 pounds as the aggregate output of the American black plate mills in the first half of 1897, or the equivalent of about 2,340,000 boxes. It is certain that these figures were materially exceeded in the latter half of the year. Practically all the works were then steadily employed and the starting in of several new mills swelled the producing capacity considerably beyond that of the first six months. Probably 5,000,000 boxes would, therefore, fairly represent the 1897 output of American tin plate. Allowing for stocks in hand at the close of the year, this would make the actual consumption of foreign tin plate in the United States only about 5 per cent. of the whole amount used, leaving the American mills to supply the other 95 per cent.

Carried away by enthusiasm over the recently published official statistics of American Tin Plate production, an Indiana newspaper comes out with the bold statement in large type head lines that "America Turns Out Four-fifths of the World's Production." This is somewhat too previous. There is a little country called Wales which still makes Tin Plate for most of the world. Still we are "getting there," and there is no telling what may happen in a few years.

Automatic Can Making Plant.

Economy of production, combined with accuracy and excellence, is the secret of success in all lines of manufacture in these days of keen competition. To this end is the multiplication of time and labor saving machinery, which is a salient feature of modern industrial conditions. In the can making industry, the Great Western Can & Machine Company of San Francisco, Cal., have brought this principle to a high development. The company named have been formed for the manufacture of tin cans under a new automatic process, the invention of Axel Johnson, which promises to work a revolution in this industry. They also control the manufacture of the specially designed machinery used in the process, which, they advise us, is fully covered by patents both in this country and abroad. The system is entirely automatic from start to finish. Whole sheets of tin are fed in at one end of a series of machines and are delivered at the other end in the form of complete, tested cans, ready for immediate use. A line of this automatic machinery, it is claimed, is capable of turning out from 30,000 to 60,000 cans in a day of ten hours, at very small expense.

THE MACHINERY.

A half-tone engraving 8 x 42 inches, furnished us by the company, gives a complete view of the Great Western plant. Its dimensions prevent a reproduction of the same in these columns, but an intelligent idea of the machines and their operation may be gathered by our readers from the following description. The plant occupies a space about 15 x 60 feet. It is composed of five machines connected together, tandem fashion—namely, a body maker, a header or can forming machine, a side seam soldering machine, a machine for soldering tops and bottoms and a testing machine. The functions of these machines are as follows :

No. 1. *Body Maker.*—This machine takes a sheet of tin, squares it, trims it, forms the lock, makes the receiving groove for the tops and bottoms, cuts four bodies at one stroke, and discharges it into No. 2. But one operator is required on this machine.

No. 2. *Header or Can Forming Machine.*—The can is made entire on this machine with the exception of soldering. It is discharged from this machine to a chute which carries it to No. 3. Two girls are required to feed tops and bottoms on this machine.

No. 3. *Side Seam Soldering Machine.*—This machine is a rotary table with a bath for the acid and solder. The side seam of the can is soldered on this machine, and the can is then carried by chutes to No. 4. The machine runs without an operator, is a self feeder both as regards solder and cans.

No. 4. *Machine for Soldering Tops and Bottoms.*—Both tops and bottoms are soldered in the same bath in this machine, one boy and one man being required for its operation. The can is then carried by a system of belts and chutes to No. 5.

No. 5. *Testing Machine.*—This is a rotary machine, which clasps the can in a clamp, plunges it in warm water and detects any leaks that there may be in the can, by submitting it to 35 pounds air pressure. One man is required on this machine.

From the testing machine the cans are carried to the drier, a machine consisting of an inclosed system of pipes, from which they emerge ready for use. The machines occupy a space of about 15 x 60 feet. This space can be economized if necessary by returning the chutes—in other words, the plant itself could easily be put in a room 15 x 40 feet. A plant to make 30,000 cans in ten hours is run with 5 horse-power. A plant to make 60,000 cans would not require over 1 horse-power more.

NUMBER OF OPERATORS.

The company advise us that they ran this plant last season with the following people:

One boy on the body machine, at $4 per week ; two girls on the header, at $8 per week. The side seam soldering machine requires no operator, as it is self feeding ; two boys on the chain machine, at $7 per week; one man on the tester, at $10.50 per week, and five inspectors, boys, averaging $4 per week. This does not include crate shifters, men to pile tin, &c. One machinist at $2.50 per day takes care of the whole line.

GENERAL DESCRIPTION OF PROCESS

The following general description of the Great Western can making machine is furnished us by General Manager Charles Josselyn :

The tin plate in boxes, as at present manufactured by machines other than ours, has to be sorted by one or more expert sorters. We have, in our machines, obviated the necessity for this and excluded that item of expense. The tin plate as taken from the box is fed to the body machine by one boy. Our machine successfully trims. forms side seam portion, slits, crimps and rolls up the sheet in proper shape into four bodies complete, which bodies are then automatically delivered to the heading machine. The heads, top and bottom are, as usual with all can makers as with us, punched out of sheets of tin plate by presses, with specially prepared punches and dies, according to the class of can required, and these machines are usually operated by girls. The presses are of two kinds, hand or foot presses and power presses, operated by belt from countershaft.

The four bodies, as mentioned, automatically delivered from the body machine to the heading machine, are now in corresponding numbers fed to the machine. This is done automatically. Suitable runways are provided for bodies and heads, and these by gravity will connectedly enter and be received by the jaws of the heading machine; these jaws, being mounted between two disks attached to main shaft, will during one revolution gradually close the bodies around the heads, automatically lock and com press the side seam and discharge the complete can perfect. For purposes of spices or other dry substances the cans do not require soldering, the tops and bottoms being most securely locked and not pushed on.

One strong point in favor of our machines is the fact that we place the heads inside of the can, and fold the can body around the same in a crimped receiving groove, excluding the possibility of the heads falling off after having been put in place.

The cans are now delivered by a combination of elevator and runway or by gravity direct to the end soldering machine, where the heads—top and bottom—are soldered to the can body. This machine of ours has been arranged in a compact and double acting way. With one common flux and solder bath, and a consequent saving of practically half the gas usually consumed, our work is done in an efficient and thorough manner.

The cans are now as before, by means of elevator and runway, delivered to the side seam soldering machine. No flux and solder will flow on the inside of our can because of the peculiar shape of our lock joint. The cans are now delivered to the testing machine to ascertain their perfect condition.

The engraving referred to, showing the machines in operation, will be sent to any one interested on application to the Great Western Can Company, 139 First street, San Francisco, Cal. The machines are already in successful operation in several canning and can making factories on the Pacific Coast.

THE TIN PLATE MANUFACTURERS.

A meeting of tin plate manufacturers was held in the Hotel Lincoln, Pittsburgh, on Tuesday, January 18. D. G. Reid of the American Tin Plate Company, Anderson, Ind., was chairman. The meeting was largely attended, nearly all the principal concerns being represented in person. Letters were received from others not able to be present. The principal business under discussion was the plan formulated at the meeting held in Columbus some time since looking to the control of the tin plate trade much on the same lines proposed by the American Steel & Wire Company in the wire trades. A more recent meeting at which this matter was under discussion was held in New York and the meeting of Tuesday was to take further action upon it. A number of tin plate concerns have put prices upon their plants, and an effort will be made to control the tin plate trade and put it on a more profitable basis. The recent low prices at which cokes and the cheaper grades of ternes have sold have in many cases been below cost of production. While the plan proposed is yet in an embryotic condition, the progress thus far made is said to be entirely satisfactory.

SCRAP.

The Humbert Tin Plate Company's plant, at Canton, Baltimore, Md., leased from the Stickney Iron Company, which is being operated as an adjunct to the company's works at South Connellsville, Pa., is reported to be running very successfully and producing about 1600 boxes a week. The plant, which covers about 2 acres of ground adjoining the Stickney Iron Works, is a two-mill works, employing about 90 men. The whole of the product is sold to Baltimore consumers for the manufacture of Cans and Tinware.

The Wais & Roos Punch & Shear Company, Cincinnati, Ohio, who have recently made some extensive additions to their equipment, have lately made the following shipments to various Tin Plate manufacturing concerns. Laughlin Nail Company, Martin's Ferry, Ohio, shear; Johnstown Tin Plate Company, Johnstown, Pa., shear; Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, billet shear; Humbert Tin Plate Company, South Connellsville, Pa., shear, and Neshannock Sheet & Tin Plate Company, New Castle, Pa , four shears.

A number of the leading tin can manufacturers of the country met in Chicago on the 10th inst. and organized the Can Manufacturers' Association of America. E. B. Breckinridge of Toledo, Ohio, presided. Permanent officers will be elected at a future meeting.

Edwin Norton of Norton Brothers, Chicago, left this week for Europe to remain abroad until April.

Owing to the want of remunerative orders, the Gwalia Tin Plate Works of South Wales were closed down on January 1 for an indefinite time.

The Joint Traffic Association has fixed the freight rate on Tin Plate and Black Plate in carloads from Connellsville, Pa., to Allegheny and Sharpsburg, Pa., at 5 cents per 100 pounds.

The calendar for 1898 distributed by James A. Coe & Co., Newark, N. J., is a handsomely decorated card measuring 14 x 10½ inches, carrying an allegorical figure who is in the act of welding on the new number 8 to the 189–. The figure is drawn in a spirited way and the coloring is pleasing. Incidentally attention is directed to Iron and Steel, Copper, Tin and Zinc, Structural Iron and Heavy Hardware handled by this concern. The calendar itself is a small pad at the lower corner of the card.

Three of the six new tin mills of the La Belle Iron Works, Wheeling, W. Va., were put in successful operation last week and are running steadily, giving the concern seven active mills at the present time. The other three new mills will also be started within a short time.

The plant of the Beaver Tin Plate Company, Lisbon, Ohio, manufacturers of Beaver Ternes and Charcoals, is running full and with excellent prospects ahead. This concern are having a large demand for their Plates and expect to run full time right through the spring and summer. This plant has been enlarged considerably since the initial works were built.

A New Enamel.

John Bentz, 912 South Charles street, Baltimore, Md., who was formerly foreman of Matthai, Ingram & Co.'s enameling works, has just been granted a patent on a new method of enameling iron ware, giving a surface entirely different from the ordinary gray enamel in common use. The new enamel is described as absolutely free from poison and requires but one coat and a single burnishing. It can be made in various styles and permits the inlaying of stones in a very simple way in any size or quantities, in stripes or other figures. This method of inlaying stones in the enamel is the chief feature of the patent, the stones being melted into the foundation coat in the burning and giving smooth surface. The new enamel, it is stated, can be made at a very low cost. Mr. Bentz, we understand, has made arrangements to manufacture this enamel with the Keen & Hagerty Mfg. Company of Baltimore.

The Illinois Central Railroad Company have contracted to carry four vessels in sections from the building yards at Jefferson, Ind., to San Francisco, Cal., for the Pacific Coast trade. The sections will load 50 cars, which will go to New Orleans and thence by the Southern Pacific road to San Francisco.

HEATING AND PLUMBING.

INTERNATIONAL HEALTH EXPOSITION.

An international exposition in the interests of sanitary science, to be held in New York City in the coming spring, promises, from the prospectus just issued, to be of unusual interest to many of the readers of *The Metal Worker*. The enterprise, with the title of the International Health Exposition, is under the management of Chas. F. Wingate as supervising director, who will have the co operation of the New York Household Economic Association and other kindred organizations, as well as the support of a strong list of members of Advisory Committees. The exposition will be held in the Industrial Building (Grand Central Palace), Lexington avenue and Forty-third street, New York, from April 25 to May 31. The projectors of the undertaking state that their object is to stimulate public interest in health matters by making a display of the best sanitary apparatus in every line. Models of buildings will illustrate the changes in construction, and the recent improvements in plumbing, heating, lighting and ventilation and sanitary defects will be illustrated by object lessons in bad work taken from existing buildings. In order to promote the educational influence of the exposition, the management will provide a daily series of popular lectures on sanitary problems by recognized authorities in their respective lines of work, and they also propose to offer special facilities to schools, teachers, physicians, health inspectors and others interested in health matters to visit the exposition.

The classified list of exhibits gives a good idea of the scope of the exposition. They are divided into a number of classes under the head of Domestic Sanitation, Municipal Hygiene, Food Products, Sanitariums, Hygienic Literature, Sanitary Organizations and their Work, Progress of Preventive Medicine, Military and Naval Hygiene, Animal Sanitation, Industrial Hygiene and Fire Protection. Of these divisions, the two first named are naturally given the greatest prominence. Domestic Sanitation embraces 11 groups, covering all the various aspects of this wide subject. These are as follows :

Group I.—The evolution of the Modern Dwelling, illustrated by plans, models and pictures of buildings at different periods and in different countries.

Group II.—The Plumbing and Drainage of Houses, contrasting past and present methods, with the drain pipes, traps and fixtures now in use and those formerly employed. This will include working models of plumbing apparatus in actual operation, to illustrate ventilation, siphonage, back pressure and other practical features.

Group III.—Injurious effects of Dampness on Health illustrated, together with right and wrong methods of preventig soil saturation.

Group IV.—Drainage of Country Houses, with plans and models of cesspools, sub surface irrigation and other modes of sewage disposal.

Group V.—A Model Cellar, showing how it should be constructed so as to secure abundant sunlight and ventilation and absolute dryness.

Group VI.—Domestic Heating Appliances ; stoves, heaters, open fire places, gas logs, hot air furnaces, steam and hot water apparatus

Group VII.—Domestic Ventilation illustrated. Common defects in ordinary houses. How to ventilate a kitchen, bathroom, halls and bedrooms in a proper manner. Ventilating fans and skylights shown in operation.

Group VIII.—Apartment Houses, Family Hotels, Office Buildings ; their special advantages and sanitary defects and how to correct them. Dangers from high buildings illustrated.

Group IX.—The Model Home ; its site and construction depicted in every detail.

Group X—Working Men's Homes as they are and as they ought to be. The Tenement House Problem in cities and its historical development. Designs of model tenements in different places.

Group XI.—Hygienic Clothing. Wall Papers and Draperies. Filters.

Municipal hygiene includes in its treatment such subjects as the sewerage and water supply of cities, public baths and laundries, garbage removal and destruction, methods of public lighting and heating, methods of sewage disposal, houses of public comfort, building regulations, &c.

Applications for space and detailed information should be made to the secretary of the International Health Exposition, Grand Central Palace, New York.

Wisconsin State Plumbers.

The fourth annual convention of the Wisconsin State Association of Master Plumbers was called to order at 11 a.m., January 12, in the Senate Chamber at Madison, Wis., by President W. H. Halsey of Milwaukee. Mayor Hoven delivered a short address of welcome. About 100 delegates were in attendance.

One of the important things decided upon was a resolution instructing the Executive Committee to prepare and disseminate throughout the State, at the expense of the association, a pamphlet on sanitation. The Executive Committee is composed of the officers of the association and the outgoing president. The question of the new State law requiring all plumbers to take an examination before being permitted to work at the trade was discussed. The discussion over the law was short, and little opposition to it was manifested. The session was executive, but several members said after it had adjourned that the members expressed themselves as favoring the law and as intending to obey it to the letter. No formal action was taken with reference to the law.

The officers elected are:

President, Charles Polacheck, Milwaukee.

Vice-President, A. V. Fetter, La Crosse.

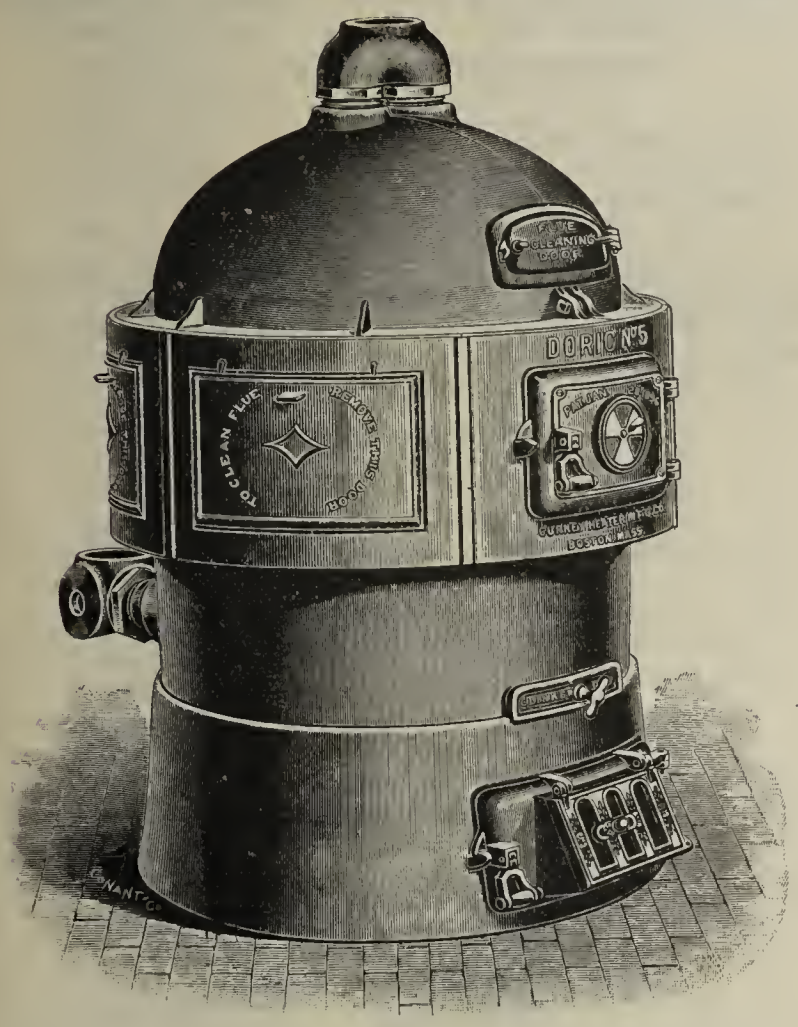
Treasurer, C. L. Rundle, Oshkosh.

Secretary, Herman A. Wittig, Milwaukee.

District Vice-Presidents: F. Green of Janesville, H. L. Larson of Manitowoc, P. J. Dullanty of Ashland, J. P. Fox of Eau Claire.

Delegates to the National Convention: W. H. Halsey and P. H. Murphy of Milwaukee, J. F. Ahearn of Fond du Lac, William Owens of Maidson.

Delegate to Interstate League, P. H. Ryan, Oshkosh.



The Hyde System of Ventilated Plumbing Work.

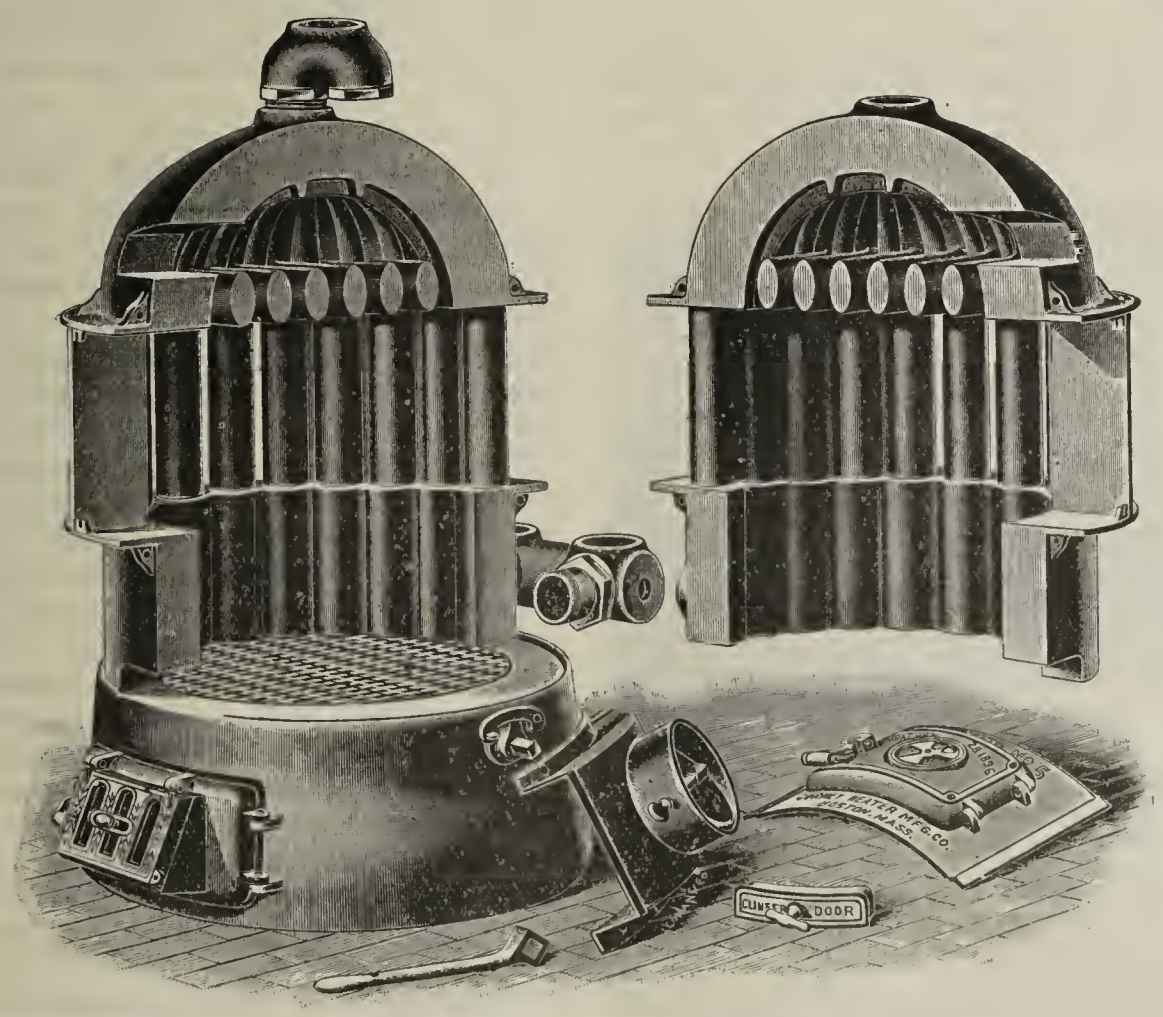
We have the following interesting letter from Thomas Hyde, Albany, N. Y., respecting his system of ventilated plumbing work, and if there are any criticisms to offer on Mr. Hyde's remarks we should be very glad to hear from our readers. He says: "I have installed my system of ventilated plumbing work in a house in this city as an experiment to prove its merits to our Board of Health, and I might say for the information of those not acquainted with the thing that the result brought about is that each soil and waste pipe performs the function of ventilated ducts, which they prove to be, the traps being abandoned. The 4-inch soil pipe carried a velocity of 150 feet per minute under unfavorable conditions. One point raised against the result was that such air escape would exhaust the room of its heat, the house being heated by a hot air furnace, but there is no other means of ventilation than what is afforded by my system. It is also mentioned that some time, no matter how favorable the conditions, a down

draft would occur in the chimney. I met that with the remark that there is no place on this earth where the operation of natural law will not give a gaurantee that no such thing can occur if the system is properly constructed. I withhold comment myself upon this system, but will be very glad to have others discuss it."

The No. 5 Doric Heating Boiler.

The Gurney Heater Mfg. Company, Boston, Mass., have added to their well-known line of Doric steam and hot water heaters an additional size known as No. 5, illustrations of which are given herewith. Fig. 1 is a general view of the boiler, while Fig. 2 shows the boiler separated in two sections revealing its internal construction. The boiler, as shown in the illustration, is for hot water, but it is also made for steam heating. The size differs from Nos. 1, 2, 3 and 4 in being made in two vertical sections or halves, connected at the top and bottom by drums and lock nut nipples, making, it is pointed out, absolutely permanent and indestructible joints. In addition to the present heating surface contained in the other sizes of Doric boilers, in this particular size a horizontal row of specially made oval loops (or water tubes) have been introduced, which are so arranged that the direct fire surface of the boiler is very largely increased. The boiler being made in two vertical sections or halves it is easily handled and placed in cellars or taken through narrow passages or doorways. The No. 5, like their other sizes, is tested to 100 pounds per square inch hydraulic pressure, and the castings being made of even thickness and of the best quality of iron insure, it is pointed out, the utmost durability. The company also inform us that they will have two additional sizes of Doric boilers ready for the market about March 15—No. 00, with a diameter of grate of 11 inches, and No. 0, with a diameter of grate of 14 inches, this giving them seven sizes of this style of boilers with a capacity for hot water of from 250 to 1600 square feet and for steam of from 125 to 1000 square feet.

The No 5 Doric Heating Boiler.—Fig. 1.—General View of Boiler.



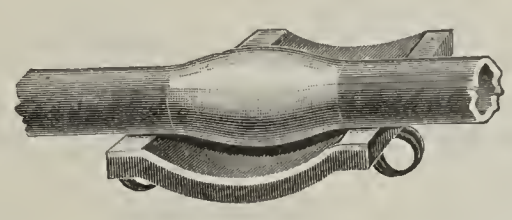


Fig. 2 —View with Halves Separated.

Porsch's Molded Wiping Cloth.

A special form of wiping cloth, for which many advantages are claimed, is made by John Porsch, 1222 Peach street, Erie, Pa., and is illustrated in connection with a wiped joint in the accompanying cut. The shape of the joint, it will be noticed, is formed in the cloth or pad and the result is, the makers state, that it is easy to wipe a smooth and uniform joint. The cloth is of rubber, cast and shaped like a joint, lined with sheet asbestos, which is a non-conductor of heat. Next to this are several layers of paper, the paper, it is pointed out, being preferable to ticking or mole skin cloth, because it insures a smooth surface immediately. In case the surface of the wiping cloth is torn another layer of paper can be pasted on without delay. Should the purchaser, however, prefer ticking it will be furnished instead of the paper. In referring to the advantages of this cloth, it is remarked that if the plumber is accustomed to wiping a heavy joint it is difficult for him to wipe a light one, while, similarly, if he is used to wiping light joints it is hard to wipe heavy ones. With the Porsch wiping cloth, however, any kind of joint can be made, either heavy, light, slim or narrow. The cloth has an elastic rubber band or finger strap, and if the operator desires he can wear kid gloves when using it.

Porsch's Molded Wiping Cloth, Used in Connection with a Wiped Joint.

THE FOURTH ANNUAL MEETING OF THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS.

On January 25 at 12 West Thirty-first street, New York, the fourth annual meeting of the American Society of Heating and Ventilating Engineers will open, and it gives promise of being one of the most interesting held by the society. We print below the programme, which this year is so arranged that those who cannot attend the entire meeting may be present when matters most interesting to them are under discussion. The reports of the officers will show the society in a prosperous condition and the substantial increase in membership is most gratifying. Those who may be in New York during the meeting and are interested in its work will be welcome as guests.

The Programme.

FIRST DAY. MORNING SESSION, JANUARY 25, 10 A.M.

ORDER OF BUSINESS.

1. Roll call.
2. Reading of minutes of previous meeting.
3. President's address.
4. Report of secretary.
5. Report of treasurer.
6. Report of chairman of the Board of Managers.
7. Report of chairman of the council.
8. Report of special committees.
9. Appointment of tellers.
10. New business.

AFTERNOON SESSION, JANUARY 25, 2 P.M.

PAPERS.

"A New Type of Hot Blast Radiator," by Geo. I. Rockwood.
Discussion.
"Some Experiments in Steam Circulation," by John Gormly.
Discussion.

TOPICS.

1. "The Rating of Heating Coils for Hot Blast Heating."
2. "Under What Conditions Is It Economical to Use Exhaust Steam When Such Use Creates Back Pressure?"
3. "Does the Present Day Competition Promote Good Engineering?"

NOTE.—The time for receiving the ballots for the annual election will expire at 3 p.m., January 25.

EVENING SESSION, JANUARY 25 7.30 P.M.

Report of tellers.

PAPER.

"A Test of the Heating and Ventilating Plant, New York State Veterinary College, Cornell University, Ithaca, N. Y.," by Prof. R. C. Carpenter.
Discussion.

SECOND DAY. MORNING SESSION, JANUARY 26, 10 A.M.

PAPER.

"Proportioning of Circulating Pipes for Steam and Hot Water Heating Systems," by J. J. Blackmore.
Discussion.

TOPIC.

4. "Does Our Society, as at Present Conducted, Meet the Objects of Its Organization as Laid Down in Article I of Our Constitution?"

NOTE.—Members, whether present or not, are especially urged to express their opinions freely on this topic for the guidance of the officers of the society.

AFTERNOON SESSION, JANUARY 26, 2 P.M.

PAPER.

"Single Pipe Low Pressure Steam Heating," by Mark Dean.
Discussion.

TOPICS.

5. "How Much Allowance Should Be Made for the Loss of Heat Through the Roofs of Churches and Such Buildings as Have Their Ceilings Attached to the Rafters on Which the Roof Is Laid?"
6. "How Are the Difficulties in the Proper Warming and Ventilating of Our Public Schools Best Met Where Steam Systems Are Used?"
7. "How Are the Difficulties in the Proper Warming and Ventilating of Our Public Schools Best Met Where Hot Air Furnaces Are Used?"

THIRD DAY. MORNING SESSION, JANUARY 27, 10 A.M.

PAPERS.

Nebraska State Plumbers.

The fourth annual convention of the Nebraska State Association of Master Plumbers was held January 10, 1898, at the Schlitz Hotel, Omaha, with some 40 members present. The meeting was called to order by President Korsmeyer, who introduced Thomas B. Culloton of Chicago, president of the National Association, who made a very able address, instructing the members what course to pursue for the benefit of the association. The question of forming a league of Nebraska, Kansas and Colorado was taken up and discussed, and Messrs. Bellamy and Korsmeyer were appointed delegates to confer with a like number of delegates from the States of Kansas and Colorado. The object of this league is the protection of the members in dealing with the manufacturers and jobbers, and it is to be on the same principle as the Interstate League of Illinois, Iowa, Wisconsin and Minnesota.

D. O. McEwan and John C. Reed were appointed delegates to attend the National Association and convention at San Antonio, Texas, with F. A. Korsmeyer and Leo Baroch alternates.

The following officers were elected for the ensuing year:

President, Wm. Bellamy, Omaha.
Viee-President, Geo. W. Cultra, Lincoln.
Secretary, G. K. Black, Omaha.
Treasurer, F. A. Korsmeyer, Lincoln.

At the close of the convention the visiting members were entertained by the local association with a spread in the Roof Garden.

Successful Plumbers at Milwaukee.

Of the 137 master plumbers who were examined by Examining Board 58 failed to pass, and have retained counsel to fight the law. There were 293 journeymen examined and 102 failed to pass. Below we give a list of the successful master plumbers:

Apel, H. C.
Baker, J. C.
Beck, William
Bigsby, C. E.
Boettger, W. C.
Bolter, W. F.
Britt, P. F.
Coogan, Edward.
Dahl, Albert S.
Dale, Burt.
Dearsley, Henry D.
Dengel, F. R.
Diele, E.
Dillman, Ed.
Dittmar, Oscar H.
Does, B.
Dorrler, Albert.
Doyn, E. T.
Egan, William H.
Eggert, L. A.
Finer, John.
Fluegge, F. A.
Foran, J. A.
Fox, Charles J.
Friend, L. R.
Fuchs, Phil A.
Grievel, F. L.
Habermahl, Eugene.
Halsey, W. H.
Hanley, S. V.
Harper, Charles
Julian, J. B.
King, F. R.
King, P. J.
Kinney, R. F.
Kuenzli, F. A.
Kuettemeyer, F. C.
Laas, A. J.
La Velle, J. W.
Lehan, F. F.
Lippert, Albert.
Luedke, Herman.
Maag, Arthur J.
Magrath, M. J.
Meyer, L. F.
Mixdorf, R. T.
Mueller, E. H.
Mueller, G. J.
Murphy, F. J.
Murphy, Peter F.
Murphy, Phil H.

Zimmermann, O. P.

Defective Plumbing Work.

The James W. Gifford Company of Attleboro, Mass., have favored us with two photographs of a pair of water closets which they have taken out, and which is an illustration of how badly work can be done by an uneducated plumber. They write: "While our city is well up to date in many things, and provided with excellent plumbing regulations, we are without an inspector of plumbing, and it sometimes happens that this kind of work is put in good buildings by the lowest bidder. It will be noticed in Fig. 1 that the back air or vent connections are brought together, and then the local vent connections run into them, making a perfect by-pass for sewer gas into the house. Then, as if this was not sufficiently hazardous to the health of the inmates of the building, this vent pipe is connected to the soil pipe stack with a 2-inch sheet metal pipe, making an opportunity for the sewer air to enter from either direction. No lead bends, ferrules or floor plates were used, but the closet screwed to the floor over the cast iron fitting below. The work was taken out, then set up again with the same pieces of pipe to be photographed. Did you ever see a worse job from a sanitary point of view?"

The general arrangement of the job as found is readily followed in the picture presented in Fig. 1. In Fig. 2 the method of connecting the local vent of the closet into the trap vent may be more clearly understood. That portion of a plumbing system which connects with the house drains should be made of a durable material, inasmuch as the air which passes through it under many conditions will be laden with moisture, which will condense and aid in the corrosion. Sheet iron is not well calculated to stand the ravages of the gases. The vent pipe should, by all means, be either of lead or cast iron, unless the building has the modern system of wrought iron pipe work. The local vent from the closet should not be connected with either the vent stack or the soil stack, but should be preferably connected with a warm chimney or run independently through the roof in a warm place, so as to induce an upward current in the local vent pipe. In some instances an enlargement in the local vent pipe is made in which a gas jet is placed to supply the heat to induce an up current. As has been pointed out, the air from the sewer could readily pass up the soil stack through the

Defective Plumbing Work —Fig 1.— View Showing General Arrangement.

Y-branch over to the closet, and even though the connection between the closet and the drain pipe were tightly made there would be nothing to hinder it passing up to the back air pipe, then around through the local vent pipe into the building, as may be readily seen by an ex-

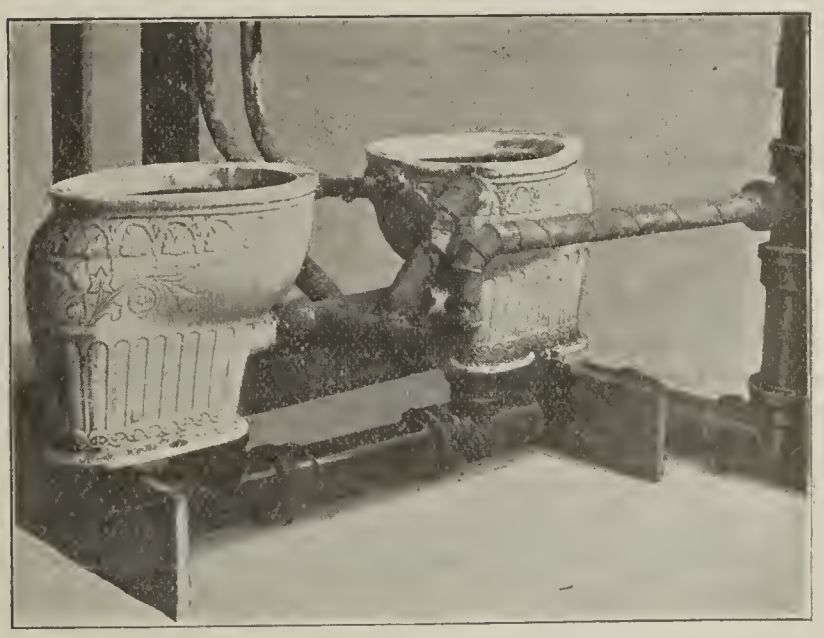

Fig. 2 — View Showing Drain Opening Into Building through Vent and Local Vent.

amination of Fig. 2. On the other hand, there would be nothing to prevent sewer air coming through the vent pipe to the local vent and passing directly into the room from the closet. The character of the plumbing regulations in the city is reflected in the work, as an attempt has been made to meet the provisions of these regulations, although the result of the attempt has been faulty through

the incompetence of the workman. Such work would never have passed had it been inspected by a competent plumbing inspector. If work of this character is brought to the attention of those who have charge of sanitary legislation, the difficulty of securing the enactment of proper laws will be very much reduced. We shall be glad to have our readers send us pictures or sketches and descriptions of such work.

Newark Master Plumbers.

The officers elected at the annual meeting of the Master Plumbers' Association of Newark, N. J., were installed on Friday, January 14 They are as follows:

President, Ira Budd.
Vice-President, W. B. Champlin.
Recording Secretary, E. A. Bleything.
Financial Secretary, Wm. Jacobi.
Treasurer, F. J. Sturn.
Sergeant-at-Arms, A. Grohman.
Trustees: C. Sullivan, A. S. Walker and C. Zimmerman.

A smoker will be given by the association in the near future, and the following committee has it in charge: A. S. Walker, Wm. Jacobi, F. J. Sturn, Robert Berla and L. Stephens. A feature of the meeting was the remarks on the benefit of association. One case was cited where a member sent his men to make a sewer connection at the time he went to get the permit, and the men were ordered to stop working by a plumbing inspector. Another member of the association, engaged in similar work on an adjoining property, interested himself to satisfy the official so that the work could go on till his fellow member appeared with the permit. In another instance a plumber was making a sewer connection near the shop of another plumber, who explained to him an easy method of opening the sewer from the inside and loaned him necessary appliances for doing it. Such actions had been unknown previous to the association, and the members were urged to get all in the trade to join the association and increase its usefulness.

Iowa Master Plumbers.

The ninth annual convention of the Iowa State Association of Master Plumbers was held in Germania Hall, Dubuque, Iowa, January 11 and 12, with the following delegates present:

Des Moines, W. Rocene, J. Haller, T. H. Kuntz, H. H. Walker, J. Linanne.
Dubuque Rob. Jungk, McDermott & Gow, W. S. Molo, Mullen Bros., M. Mullen, B. Pape, W. J. Nesler.
LeMars, Charles Syms.
Manchester, George L. Leisler.
Maquoteka, J. Kleinfelder.
Marshalltown, David Coulton, W. L. Reed.
Muscatine, P. J. Barney.
Sioux City, J. H. Durkie.
Waterloo, W. B. Griffin, F. Kramer.
Waverly, W. H. Temple.
Cedar Falls, J. Sheerer, L. Wartman.
Cedar Rapids, E. O. Edron, George McDonald, Messner & Co., H. F. Miller, George Myers, W. H. Taylor, William Yates.
Clinton, George Kendall.
Davenport, R. Clayton, F. Wernentin, G. F Ahrens, Hy. Durkee, S. Deidrichsen.

The official reports showed a membership of 124, an increase of 10 per cent. during the year, and a good balance in the treasury.

Four new local associations were formed during the year, namely: Mason City, with four members; Charles City, with four members; Clinton, with six members, and Boone, with five members.

One local dissolved during the year, Keokuk, leaving 16 locals now in force.

The local association entertained their guests with a banquet and a dance, which were thoroughly enjoyed. On the second day the convention decided to purchase printed matter dealing with the importance of good plumbing to be distributed to the best advantage. President Ahrens in his address dwelt on the need of a plumbing law in the State and related the good results that had been attained in Davenport through the adoption of an ordinance requiring an inspector of plumbing, James Cameron. Mr. Cameron was introduced as the only plumbing inspector in Iowa, and gave an interesting account of his duties and experiences.

After disposing of the general business of the convention the following officers were elected for the ensuing year:

President, Fred Wernentin, Davenport.
Vice-President, W. S. Gow, Dubuque.
Secretary, E. O. Edson, Cedar Rapids.
Treasurer, George Stewart, Burlington.
Delegate to the National Convention, W. Rocene, Des Moines.
Alternates: C. G. Boesechi, Burlington, and Robert Clayton, Davenport.

The president and secretary are constituted, *ex officio*, delegates to the national convention, giving this association three delegates.

Missouri Master Plumbers.

We give herewith a complete list of the officers of the Missouri State Association of Master Plumbers, elected at the convention at St. Joseph, Mo., and of which we gave an account last week:

President, M. J. Ward.
First Vice-President, E. D. Hornbrook.
Second Vice-President, R. T. Connell.
Treasurer, Henry Goss.
Secretary, Wm. Schwehr, Jr.
Delegates to the National Convention: Jeremiah Sheehan, E. D. Hornbrook and M. J. Ward.

After the election the following committees were appointed:

Constitution and By Laws: J. S. Sheehan of St. Louis, E. D. Hornbrook of Kansas City and I. T. Hopper of St. Joseph.
On Credentials: Thomas Tuffy of St. Louis, Henry Goss of Kansas City and M. W. Jackson of St. Joseph.

The Boston Clean Out.

In the accompanying illustration we show the Boston clean out, made by Crawford & Young, 224 Franklin

The Boston Clean Out —Fig. 1.— With Cover On.

Fig. 2.—Showing Cover Removed.

street, Boston, Mass. It is designed for use in connection with drain pipes, and is made 4 inches in diameter, and so that it can be readily calked into the hub. Fig. 1 shows the clean out with the cover tightly held in place with a brace provided for the purpose. Fig. 2 shows the brace turned so that the cover can be removed. It is made with a ground joint, so that it is said to be perfectly tight without the use of a washer, and it is much more convenient in use than the old method of screwing a cover off and on. The claim is made that it is absolutely water tight under all pressures. The body is of cast iron neatly japanned, and it is provided with a heavy cast brass cover, so that a firm uniting of the parts by corrosion is impossible.

DAY CLASS IN STEAM AND HOT WATER FITTING.

The excellent training given to those who have attended the Day Class in Steam and Hot Water Fitting at the New York Trade School has had the effect of bringing a larger number to the school than ever before. The class numbers 22 and is under the supervision of Thomas E. McNeill, who lectures twice each week. When at work in making coils, running pipes, connecting radiators, traps, pumps and the various appliances of both high and low pressure steam systems and hot water systems, the class is in the charge of Benjamin D. Thompson. In order that the scholars may become familiar with plans, lessons in drawing have been added to the course. The names of the class which entered on the three months' course January 5 are as follows :

Barber, Calvin J., Rockport, N. J.
Bowman, Ralph F., Millersburg, Pa.
Feeley, Jas. E., Lenox, Mass.
Fox, Edward E., Eau Claire, Wis.
Franklin, Laurence, Melrose, Mass.
Gartner, Louis, New York City.
Geoghegan, Joseph G., New York City.
Goss, Eugene W., Auburn, Maine.
Hardendorf, Del. S., East Albany, N. Y.
Hegel, James S., Peekskill, N. Y.
Hoffman, Stuart I., East Orange, N. J.
Johnson, John N., Millersburg, Pa.
Kirton, J. D., New York City.
Kuhn, Wm. H., Bridgeport, Ohio.
Nick, Oscar H., Erie, Pa.
O'Brien, Harry A., New York City.
Quinn, William, Salem, N. Y.
Ransom, James R., Plymouth, Mass.
Revitt, John H., Newark, N. J.
Searl, Arthur E., New York City.
Seavor, Stephen, New York City.
Stevens, Isaac J., Hazleton, Pa.
Thompson, Alex. C., North Sydney, Cape Breton, Can.

Paterson Master Plumbers.

The Master Plumbers' Association of Paterson, N. J., have elected the following officers for 1898:

President, John H. Quinn.
Vice-President, John Baker.
Recording and Financial Secretary, John Campbell.
Treasurer, Andrew J. Fielding.
Sergeant-at-Arms, Adolph Weber.
Trustees, James Kearney, John Baird, Charles Leitch.
Sanitary Committee, John Hickman, Charles Schneider, Charles Seibel.

In reporting the condition of the association, Secretary John Campbell, 26 Lake street, says that while the Paterson local is not so strong in members as some of her sister locals they are loyal to the constitution and by-laws of the National Association. We learn from Mr. Campbell that the Assemblymen and Senator from Passaic County have pledged themselves to support any reasonable measure that may be introduced in the Legislature to protect the people from being poisoned to death by the botched plumbing work that is being done all over the State by so-called plumbers.

NOTES.

A consolidation of the sanitary ware potteries of New Jersey and the West is being talked of as among the possibilities. A press dispatch of recent date from Trenton, N. J., asserts that all the leading potteries in that State are in sympathy with the movement. William Burgess, of the International Pottery, is mentioned as prominently identified with the scheme. The objects of the combination are said to be to reduce the cost of production and lessen office and selling expenses; also to control the output of certain necessary materials, such as feldspar.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until February 7, for a Low Temperature Hot Water Heating Apparatus for the United States Custom House and Post Office Building at Norfolk, Va.

The good work done by the International Correspondence Schools, Scranton, Pa., in the line of plumbing, heating and ventilation is indicated in a little pamphlet the schools issue containing letters from many scholars in different parts of the United States testifying to the benefits they have derived from taking a course of instruction by correspondence.

W. A. Wadsworth of the Wadsworth Plumbing Company, Cleveland, Ohio, in discussing the differences between the master plumbers and journeymen in reference to the apprenticeship question, said: "The men do not really object to working with helpers. In fact, they are anxious that helpers should be employed. What they are holding out against is working with apprentices. If the journeymen were given their own way the trade would pass out of existence in another generation. If there are to be no apprentices how are the journeymen to be recruited? The whole issue is utterly absurd. No labor organization has the right to say that the young men of this country shall not learn a particular trade. Where would these same journeymen be had the right of learning a trade been denied them?"

George McKnight has opened a plumbing shop in the basement of the Munn Building, Freeport, Ill.

Mayor Taggart of Indianapolis, Ind., has vetoed the ordinance regulating plumbing in that city, owing to section 27 being too drastic, as it allowed but ten days for connections to be made with the sewer for all buildings where vaults or cesspools are now used.

Building Inspector Turnbull, Hartford, Conn., has been sending out notices to the various plumbers in the city announcing that hereafter the use of flexible rubber elbows will not be allowed in the vent connection of closets, sinks, bathtubs or other similar work in the construction of new houses. Violation of this rule will be punished when discovered.

M. T. Baine, 315 North Summer street, Nashville, Tenn., sustained a $300 loss through a fire in his plumbing establishment last week.

W. A. Butler, who is a plumber, has been appointed supervisor of the *City Record*, the official paper of New York City.

Skeer & Young succeed Skeer & Blough in the plumbing and tinsmithing business at La Grange, Ind., D. Young having purchased the interest of F. Blough.

John Stock & Sons, San Jose, Cal., bid $3685 and secured the contract for plumbing the Hensley Block.

R. J. O'Crowley, Jr., who is representing the Henry McShane Mfg. Company, Brooklyn, N. Y., lives in Newark, N. J., and is building up a fine trade among the plumbers in New Jersey.

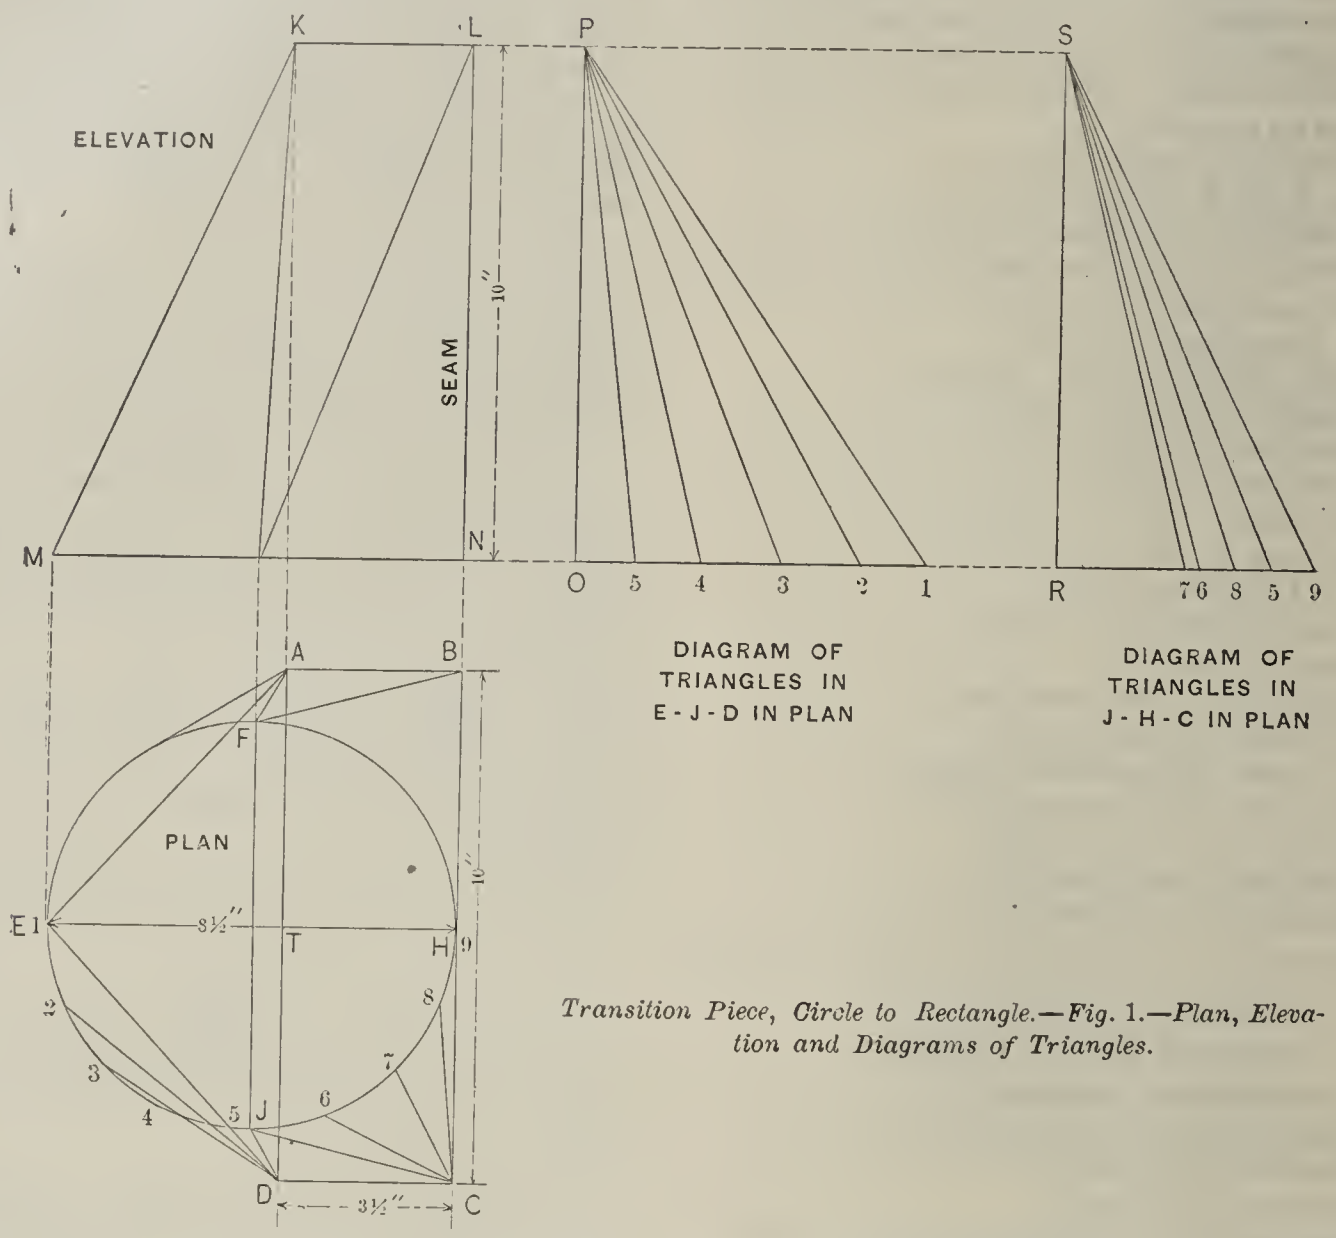
J. Frederic Mauer of the Crosby Steam Gage & Valve Company, 78 John street, New York, is bringing to the notice of the heating trade the Crosby Spring Seat Steam Valve, a feature of which is a removable disk and seat, so that the valve body may be used indefinitely by renewing these parts when necessary. A circular is published by the house, giving full particulars.

Alonzo Derby succeeds the plumbing firm of Whiting & Derby, at Stratford, Conn.

An announcement is made in the *City Record* of Boston, Mass., of the establishment of a repair division under the Building Department, with Charles Logue as chief, to make repairs to the plumbing, gas fitting, heating and roofing of public buildings.

Hardwicke & Co. have been incorporated at Niagara Falls to do a heating and plumbing business. Capital $5000, and directors: William H Cookman of 122 Sixth street; F. H. Salt and A. H. G. Hardwicke of Niagara Falls.

At the annual meeting of the Examining and Supervising Board of Plumbers, at Rochester, N. Y., George H. McCaffrey was elected president. The board consists of George H. McCaffrey, Alfred O. Kane, David C. Smith, J. Henry Howe, James F. Hogan, and the city engineer.



Robert L. Oman, plumbing inspector of Newport, R. I., in his annual report states that he has made 385 inspections of plumbing work. He has found galvanized sheet iron pipe used for the waste in connection with a number of fixtures, and recommends that a clause be inserted in the plumbing regulations to prevent its use in future. During the year 202 plans for plumbing work were filed in his office for work amounting to $40,137.

Articles incorporating the Detroit Valve & Washer Company, Detroit, Mich., have been filed. The capital stock is $10,000, of which $8000 is paid in. The stockholders, all of Detroit, are as follows: James C. McIlroy, 400 shares; Horace G. Lobenstine, 399; Wm. H. McBryan, 1 share.

SHEET METAL WORK.

TRANSITION PIECE, CIRCLE TO RECTANGLE.

A correspondent asks us to publish in *The Metal Worker* the best method for obtaining the pattern for a transition piece from circle to rectangle, a plan and elevation being shown in Fig. 1, which we reproduce from his sketch. A B C D shows the plan of the rectangular top on the line K L and E F H J the plan of the round base on the line M N in elevation. K L N M shows the elevation of the article, being 10 inches in hight, while the horizontal measurements are shown on the plan. Through the center point of the circle in plan draw the horizontal line E H and the vertical line J F, intersecting the circumference of the base at the points E, F, H and J. From these points draw lines to the corners of the rectangle, as shown by E A and A F, F B and B H, H C and C J, and J D and D E. Now divide the half circle shown by E J H into equal spaces, as indicated by the small figures 1 to 9. From these points draw lines to the corners of the rectangular top, as shown by solid lines 2 D, 3 D, 4 D and 5 D; also draw lines 5 C, 6 C, 7 C, 8 C and 9 C, which will represent the bases of the triangles which will be con-

Transition Piece, Circle to Rectangle.—Fig. 1.—Plan, Elevation and Diagrams of Triangles.

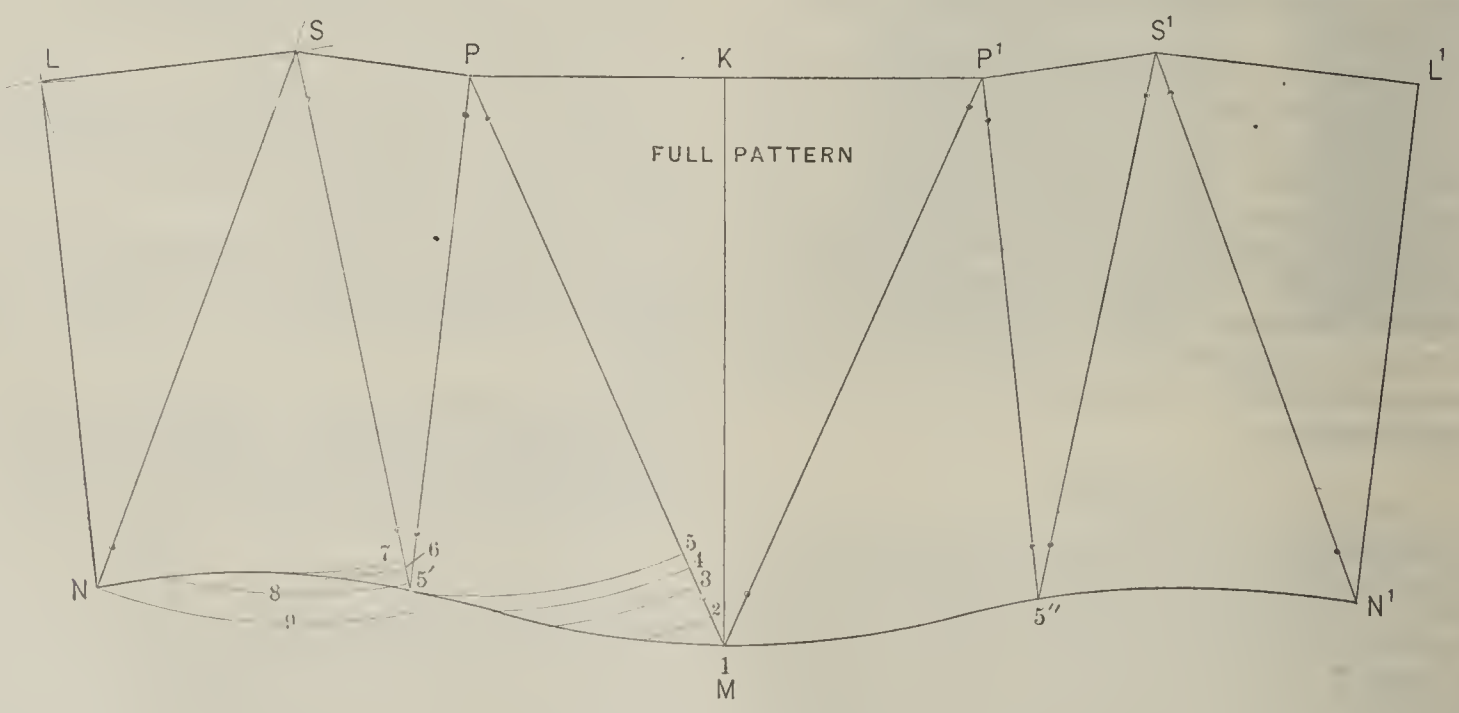


Fig. 2.—The Pattern Shape.

structed for use in the development of the pattern. Equal in hight to L N draw the vertical line P O. At right angles to P O draw the line O 1. Now take the various distances from D in plan to points 1, 2, 3, 4 and 5 and place them as shown from O to 1, 2, 3, 4 and 5 in the diagram of triangles. From these points draw lines to the apex P. Then will these lines represent the actual distances taken on corresponding lines in plan in E J D. In the same manner, equal to L N in elevation draw the vertical line S R. At right angles to S R draw the line R 9, upon which set off the various distances from C in plan to points 5, 6, 7, 8 and 9. From these points draw lines to the apex S, which will represent the actual distances taken on corresponding lines in plan in J H C.

For the pattern proceed as follows: Assuming that the seam is to come at the point H in plan, or L N in elevation, draw any vertical line. K M of Fig. 2, equal to K M in elevation, Fig. 1. At right angles to K M, Fig. 2, draw the line K P, equal to T D in plan, Fig. 1. Draw a line from P to M in Fig. 2. Now with P as center, and the various hypotenuses P 1, 2, 3, 4 and 5 of Fig. 1 as radii, describe arcs shown by 1, 2, 3, 4 and 5 in Fig. 2. Now set the dividers equal to the distance 1 to 2 or 2 to 3 of the plan, Fig. 1, and commencing at the point 1, or M, in Fig. 2, step from 1 to arc, then 2 to 3, to 4 and to 5. Draw a line from 5′ to P. Now with P as center, and D C in plan, Fig. 1, as radius, describe the arc S of Fig. 2. Then with 5′ as center, and S 5 in the diagram of triangles, Fig. 1, as radius, describe an arc intersecting the arc S in Fig. 2. Draw a line from 5′ to S. Now with S as center, and the various hypotenuses S 5, 6, 7, 8 and 9 of Fig. 1 as radii, describe arcs shown by 5′, 6, 7, 8 and 9 in Fig. 2. Now set the dividers equal to the spaces contained in the half circle in plan, Fig. 1, and commencing at 5′ of Fig. 2 step to arcs 6, 7, 8 and 9, as shown. Draw a line from N to S. Now with N as center, and N L in elevation, Fig. 1, as radius, describe the arc L in Fig. 2. Then with S as center, and C H in plan, Fig. 1, as radius, describe an arc intersecting the arc L in Fig. 2. Draw a line from L to N and trace a line through points of intersections on the arcs 1 to 9, as shown from N to M. Then will L S P K M 5′ N be half the pattern. Trace the other half opposite the line K M, as shown. Then will L L^1 N^1 N be the full pattern.

AMERICAN ROOFING SLATE IN 1897.

Although falling short of the expectations formed for it at the beginning of the year, the roofing slate trade of the United States in 1897, taken as a whole, was not unsatisfactory to the producers and dealers. The total volume of business done was about on a par with that of the previous year, but the prices obtained for the product were more satisfactory, leaving a better margin of profit than was the case in 1896. The disappointing feature of the year's business was a marked falling off in the domestic consumption, due to the slackness which prevailed in the building industry. This was offset, however, by a remarkably heavy foreign demand, which nearly trebled the exports of American roofing slates as compared with those of 1896. Continued scarcity of Welsh slates in the European market, owing to the prolonged strike at the great Penrhyn quarries, and the high prices ruling on the other side of the water combined with an unusually active demand for the material abroad to stimulate the sale of American slates in Europe, with the result that the total output of roofing slates in this country fully equaled that of 1896, notwithstanding that the shipments from quarries for home use showed a radical decline.

Through the courtesy of John Galt, head of the well-known slate dealing and mining firm of John Galt & Sons, New York and Chicago, who, from his long and extensive experience in the trade, is probably as high an authority on slate matters as any one in the United States, we are enabled to present some interesting statistics of the output and exportation of roofing slates last year. These statistics were carefully compiled by Mr. Galt from information secured from official and private sources and fairly represent the actual figures for the year. The figures relating to shipments from the Pennsylvania and Vermont quarries are official, having been obtained from the records of the transportation companies, while the shipments from other points are estimated from reliable data received from the quarries. The statistics are as follows:

Shipments to tidewater at Philadelphia, Baltimore, Hoboken, Jersey City and Newport News (representing exports) from January 1 to December 31, 1896 and 1897:

	1896. Tons.	1897. Tons.
From Northampton County, Pa., including the Bangor and Pen Argyl region	18,196	38,038
From Lehigh County, Pa., including Lehigh quarries	15,585	18,000

Shipments to points in the United States for domestic consumption:

	1896. Tons.	1897. Tons.
From Northampton County quarries	84,992	75,184
From Lehigh quarries	55,097	48,827

Shipments from Vermont quarries both for domestic consumption and export:

	Tons.
1896	96,400
1897	90,107

Shipments from other quarries in 1897:

	Tons.
Peach Bottom, York County, Pa	6,000
Maine	5,000
Buckingham County, Va	4,000

This gives a total output of 285,156 tons.

The total 1897 output of roofing slates in squares, from all sections, was in round figures as follows:

	Squares.
Bangor, Pa	175,000
Pen Argyl, Pa	130,000
Slatington, Pa., Lehigh section	120,000
Chapman, Pa	25,000
Peach Bottom, Pa	25,000
Virginia	15,000
Vermont (including sea green, unfading green and variegated)	250,000
Brownsville and Monson, Maine	25,000
Total	765,000

It is impossible to give the correct number of squares of roofing slate exported, or the actual value of the slate when shipped at United States ports, the records being kept in values and not in tons. The values, moreover, are calculated variously at the different ports of shipment, some being the value here and some the value at destination. Mr. Galt has arrived, however, at an estimate of the amount of tonnage by calculating three and three-quarter squares to the ton, and the value at destination with 10 per cent. added for insurance. In this way he gets the following figures, which illustrate the extraordinary gain in the amount and value of exports of American roofing slates during the past two years:

Total export shipments of roofing slate from the United States, 1895-1897:

1895.— 2,275 tons, valued at	$40,952
1896.—18,145 tons, valued at	326,573
1897 (to November 30).—48,800 tons, valued at	873,342

These export shipments were made almost wholly to the United Kingdom, going principally to London, Cardiff, Manchester, Bristol, Dublin and Liverpool, although some good sized orders were filled for Hamburg, Germany. The home market is found mainly in Ohio and further West, probably half of the total amount being consumed in the State of Ohio. The South also took a fair share of the domestic shipments, the city of New Orleans, La., being a large consumer of roofing slate.

The outlook is regarded as favorable for a very good year's business in 1898, both as to volume and prices. The foreign demand keeps up in good volume and seems likely to continue for some time longer, as there is still a pronounced shortage of roofing slate on the other side of the water, and the Welsh quarries are so well booked up that they are refusing orders for deliveries within six months or more. Moreover, the price of Welsh slate is relatively much higher than that of the American product delivered in the United Kingdom. Stocks in the United States are low, too, especially in the larger sizes, which are decidedly scarce, and prices are quite strong with something of an upward tendency. The amount of building in contemplation in the slate using districts is large,

and there are grounds for anticipating an increased demand for this roofing material during the present year of from 25 to 50 per cent. over that of 1897.

IRON ROOFING ASSOCIATION.

The twelfth annual meeting of the National Iron Roofing Association was held at the Grand Hotel, Cincinnati, Ohio, January 18 and 19. The first day's business was devoted exclusively to the work of the various executive committees, the real business of the meeting being transacted on the last mentioned date. The industry was represented by the following firms, viz.:

American Corrugating Company, St. Louis, Mo:, by H. P. Lloyd.

American Steel Roofing Company, Cincinnati, Ohio, by Geo. M. Verity.,

Ætna Standard Iron & Steel Company, Bridgeport, Ohio, by W. H. Eaton.

Chas. H. Connor & Co., Louisville, Ky., by E. H. Connor.

Chattanooga Steel Roofing Company, Chattanooga, Tenn., by J. E. Annis.

Cincinnati Corrugating Company, Piqua, Ohio, by J. G. Battelle and J. H. Frantz.

Cambridge Roofing Company, Cambridge, Ohio, by J. B. Outland and H. C. Hornbrook.

Garry Iron Roofing Company, Cleveland, Ohio, by Geo. E. Needham.

Globe Iron Roofing & Corrugating Company, Cincinnati, Ohio, by A. L. Andrews.

Gedge Bros., Anderson, Ind., by B. H. Gedge.

Hyndman Steel Roofing Company, Cincinnati, Ohio, by R. J. Hyndman.

W. A. List & Co., Wheeling, W. Va., by W. A. List.

St. Louis Corrugating Company, St. Louis, Mo., by G. A. Banantine.

E. E. Souther Iron Company, St. Louis, Mo., by A. G. Souther and F. E. Codding.

New Philadelphia Iron & Steel Company, New Philadelphia, Ohio, by H. D. Westfall.

American Tin Plate Machine & Mfg. Company, Canal Dover, Ohio, by S. Y. Buckman.

T. C. Snyder, Canton, Ohio.

A large number of letters were received by the secretary from those unable to be present, expressing their regrets.

The morning session was entirely taken up with the appointment of various committees and the discussion of details having for their basis the betterment of trade conditions. One of the principal features of the discussion was the use or adoption of a specific paint formula, the object being to adopt a uniform weight, quantity and quality. Prices were also dwelt upon, it being the consensus of opinion that in view of a reasonable certainty of an advance in raw material producers of roofing must of necessity ask a corresponding advance in the finished product, and that in the very near future, too. The meeting closed with the election of the following officers, to serve during the ensuing year, and the formation of an Executive Committee:

Geo. E. Needham, Cleveland, Ohio, *president.*

E. E. Souther, St. Louis, Mo., *vice-president.*

Geo. M. Verity, Cincinnati, Ohio, *secretary and treasurer.*

EXECUTIVE COMMITTEE.

Alex. Glass, Wheeling, W. Va.
E. Langenbach, Canton, Ohio.
J. G. Battelle, Piqua, Ohio.
J. E. Annis, Chattanooga, Tenn.
A. L. Andrews, Newport, Ky.
H. C. Hornbrook, Cambridge, Ohio.

John Galt & Sons, the well-known wholesale dealers in Roofing Slate, with offices at 253 Broadway, New York, and 915 New York Life Building, Chicago, have made a new departure in the issuing of their price list of American Roofing Slate for January, 1898, in the form of a small booklet of 20 pages. In addition to the net prices of all kinds of Slates, a considerable amount of useful information is presented in the publication, including tables of weights and sizes, freight rates, details as to the various qualities and descriptions of Roofing Slate, price-list of Slaters' Supplies, with illustrations of tools needed and other information useful to roofers and contractors.

Change in Firm Name.

The firm of Rhodes, Dickelman & Co., manufacturers of iron and steel roofing, galvanized eave troughs, conductor pipe, &c., at Forest, Ohio. whose term of partnership expired January 1, 1898, by limitation, have been succeeded by the Dickelman-Bowers Mfg. Company, with J. L. Dickelman of the old firm in charge of affairs as general manager, L. S. Dickelman as secretary and F. M. Bowers sales manager, both of the latter gentlemen having for years been with the old firm also. The new firm are adding a number of specialties to their already extensive line of sheet metal supplies and desire to assure the trade that it will be their constant aim to furnish the same courteous attention, prompt service and high grade products as in the past.

The new firm will continue the former force of salesmen, and with the exception of change in firm name and increased facilities for serving their customers, will make no change in the conduct of the business. In addition to the line of specialties manufactured, they will also job a full line of tin plates, solders, copper, rivets, black and galvanized sheets and general sheet metal supplies.

FLASHINGS.

The Wheeling Corrugating Company, Wheeling, W. Va., manufacturers of Corrugated Iron, Steel and Tin Roofing, advise us that the statement that they would erect a Black Plate mill is without foundation. They do not contemplate any additions to their plant at this time.

The Newport Cornice & Furnace Company have been incorporated at St. Louis, Mo., with a capital stock of $5000, by Ellen J., Mary I., John J. and Lawrence S. Newport.

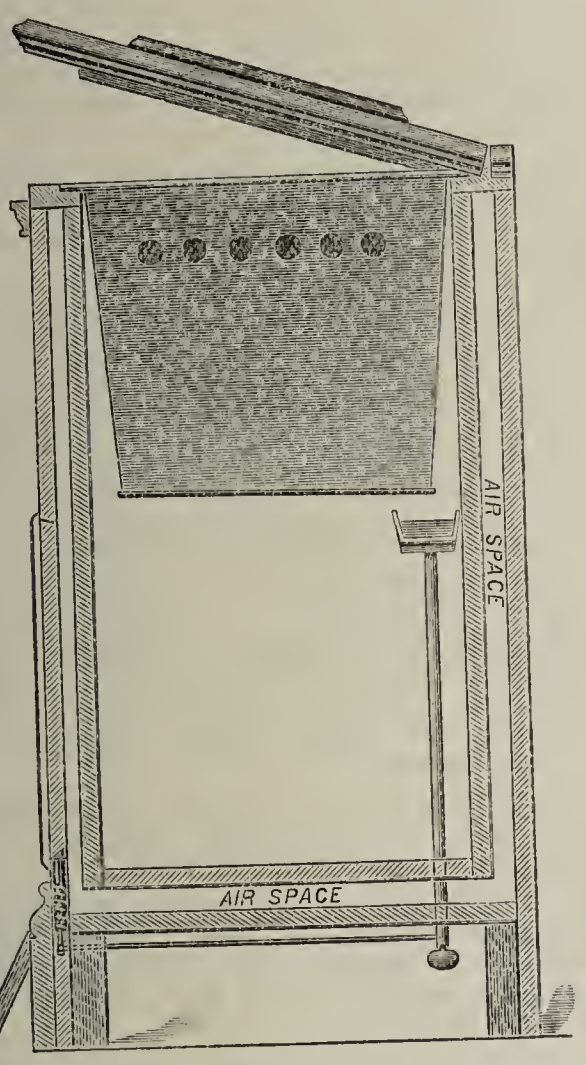
The Kinnear & Gager Co., Columbus, Ohio., have been enjoying a splendid trade on their specialties, Sheet Metal Ceilings and Rolling Iron Shutters, Partitions, &c., for some time past. Of the former, shipments have been made recently to San Domingo, Honolulu and Mexico. The company are supplying their larger forms of Shutters or Partitions with motors for greater ease of operation.

The annual meeting of the Bangor Slate Roofers' Association was held at Bangor, Pa., on January 19. Fifty operators were present. The election of officers resulted as follows: President, Elkanah Drake of Newark, N. J.; vice-president, William Bray of East Bangor; secretary and treasurer, Thomas Ditchett of Bangor; inspector, Horatio Miller of Bangor. Executive Committee: R. S. Brown of Easton, Cotton Amy and James Masters of East Bangor.

Denis J. Whelan, Troy, N. Y., since assuming the business which includes the manufacture of the Capitol Gutter Former has notably improved the machine to the extent that it is now more durable, simple and rapid in operation. The present capacity of the machine is 1000 feet of perfectly formed gutter per hour, instead of 600 feet as heretofore, while the rolls now in use in the Capitol Gutter Former are of tubular steel.

Charles Hemje, 87 Main street, Annapolis, Md., has recently secured a patent on a heater for which he claims a number of important advantages. The heater consists of three cylinders forming two annular spaces, the outer one of which is closed at the top and bottom and provided with suitable means for the admission of the products of combustion into this outer annular space, while by means of the inner cylinder a forced circulation through the inner annular space is produced, the cold air being taken from the floor and discharged at the top through a circular opening. These heaters can be used with any stove, including a cook stove, and as the heating is done entirely by the waste chimney heat it accomplishes, the inventor claims, a great saving in coal. There are other advantages claimed for this device, the patent for which Mr. Hemje is seeking to dispose of by sale or lease of State rights, as explained in an announcement elsewhere.

Paul du Chaillu, the famous African explorer and hunter, will lecture on Tuesday, January 25, at 8 p.m., in the Auditorium of the New York Trade School, Sixty-seventh street and First avenue, on "The Great Forest of Equatorial Africa." The lecture, which will be illustrated by numerous stereopticon views, is open to the public without charge. Tickets can be had on application to the New York Trade School. This is the second illustrated lecture of the present series. Announcement of the third lecture will be made shortly after February 1.



THE RETAIL STORE.

CONSOLIDATION OF ENAMELED WARE MAKERS.

The proposed enameled ware consolidation seems to have resolved itself into a combination of four large concerns—namely, the St. Louis Stamping Company of St. Louis, Mo.; the Central Stamping Company of New York, Kieckhefer Brothers Company of Milwaukee, Wis., and Matthai, Ingram & Co. of Baltimore, Md., three of which firms are makers of enameled ware and one of tinware. It is understood that the concerns named have definitely decided to consolidate their business. Other firms which were at one time expected to join the combination have, for one reason or another, drawn out of the scheme, mainly, it is said, on account of differences of opinion in regard to the valuation of their plants. A meeting of the interests involved in the consolidation is to be held in New York on Monday, where the final arrangements are expected to be consummated.

New Columbia Refrigerators.

Cooper & McKee, 119 Gwinnett street, Brooklyn, N. Y., in their new Columbia hardwood refrigerators embody certain improved features that will interest the trade. Fig. 1 is a sectional view of the refrigerator, showing the ice chamber and the arrangement of the automatic siphon. Fig. 2 is a broken view of the ice chamber showing its

New Columbia Refrigerators.—Fig. 1.—Sectional View through Refrigerator.

construction and the method of air circulation provided for, while Fig. 3 is an enlarged detail view showing the siphon connection. Referring to the removable ice chamber, which can be lifted out for cleaning or other purposes, and put in without the slightest difficulty, it will be seen that there are no fittings or intricate parts. It is made of heavy galvanized steel with holes stamped through the bottom and around the top for air circulation. The openings in the bottom, which are thrown up with a slight flange on the inside to prevent condensation dropping down through them, are covered with a corrugated rack to further prevent any drip to the food chamber below. The waste water and any condensation goes into the gutter on the back, which is also removable, and through the pipe and automatic siphon to the pan placed beneath the refrigerator. Referring to Fig. 3 the general operation of this automatic siphon will be understood. Its operation

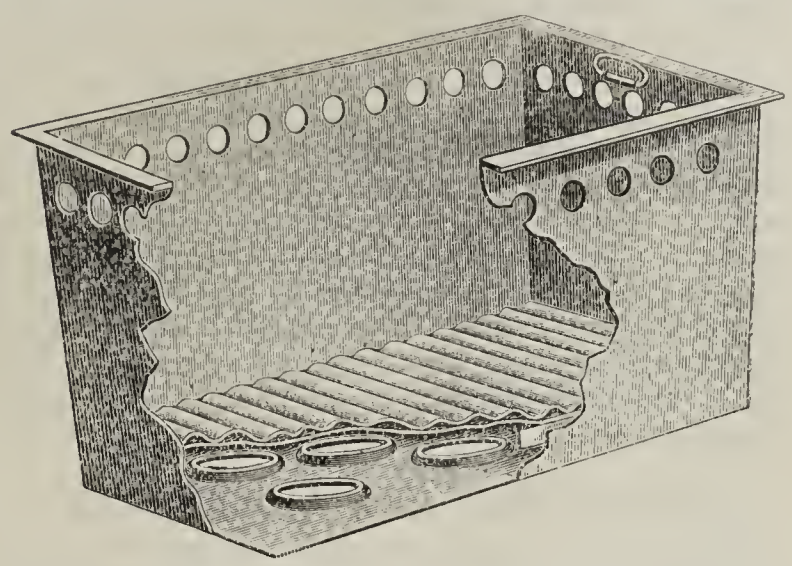


Fig. 2.—Broken View of Ice Chamber.

by the opening and closing of the door is simple and positive. It is fastened to the bottom of the refrigerator and connected by a lever to a pin going through the sill and held in position by the door when the latter is closed. On opening the door it drops, emptying any accumulated water, and closing the door returns it to its proper position, when the drip from the ice makes a seal preventing the entrance of warm air and retaining the cold air in the refrigerator. In referring to their refrigerators, Cooper & McKee say that this season they have discarded the use

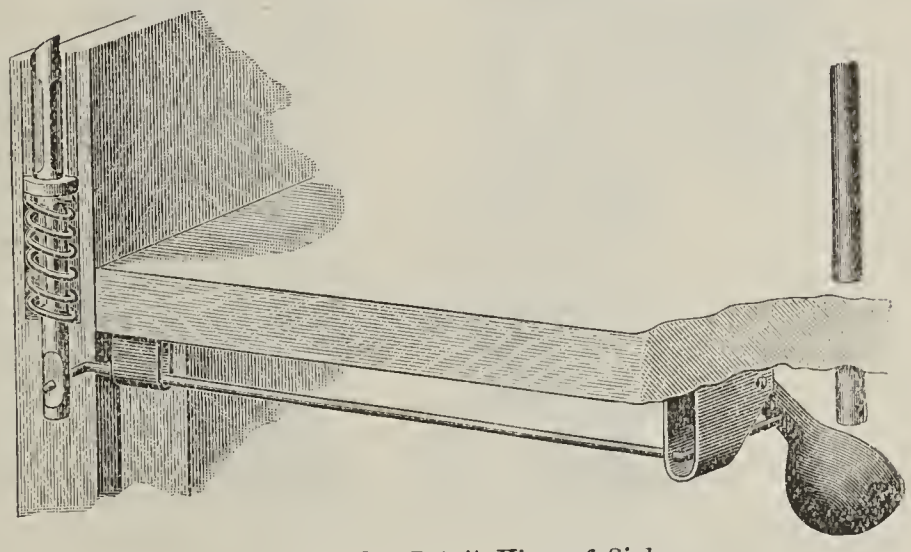

Fig. 3.—Detail View of Siphon.

of charcoal because of its dirtiness and liability to sift out, and have used the modern style of insulation with wool, felt or plaster boards and charcoal sheathing, which always keeps its position and is air tight. The company, since last season, have built another four-story warehouse, giving them unexcelled storing facilities and enabling them to make prompt shipments of all sizes.

Reading Stove Dealers' and Metal Workers' Association.

The annual meeting of the Stove Dealers' and Metal Workers' Association of Berks County, Pa., was held on the evening of Thursday, January 13, at Barbey's Café, Reading. The report of the treasurer made a very flattering showing. The election of officers resulted in the following:

President, Frederick H. Kneipe.
Vice-President, John L. Fett.
Secretary, Geo. G. Ritter.
Treasurer, M. J. Snook.
Auditing Committee, George Hauck, L. W. Dundore, Henry Lewis.

After the business meeting had been concluded a ban-

quet was held, the toastmaster being Mr. Barto of the Abram Cox Stove Company of Philadelphia.

I. E. Palmer.

I. E. Palmer, Middletown, Conn., the well-known manufacturer of Hammocks, Crinoline Linings, Mosquito Netting, Canopies, &c., is now giving special attention to the requirements of large buyers in this line. Mr. Palmer has lately put on the market an innovation in Hammocks which is styled the Utopia, of which a full description was given in *The Metal Worker*, January 1. This Hammock is a radical departure from the styles with which the trade are familiar and is offered as superior to any other on the market, and an improvement on his well-known Arawana. The peculiar construction of the Utopia permits its use in a number of positions varying from a sitting position to a sleeping position, the adjustment being easily and quickly effected. The 1898 catalogue of Mr. Palmer gives an idea of the completeness of the line of goods he is manufacturing, including as it does Canopy Fixtures and Attachments, Window Screen and Piano Cloth, Hammock Suspension Devices, &c., in addition to the lines mentioned above. An assortment of School Bags is also shown.

Hermance Non-Spilling Safety Lantern.

Glens Falls Lantern Company, Glens Falls, N. Y., are manufacturing the Hermance Safety Tubular Lantern, illustrated in Figs. 1 and 2. Fig. 1 shows the method of removing the chimney to clean it or light the burner.

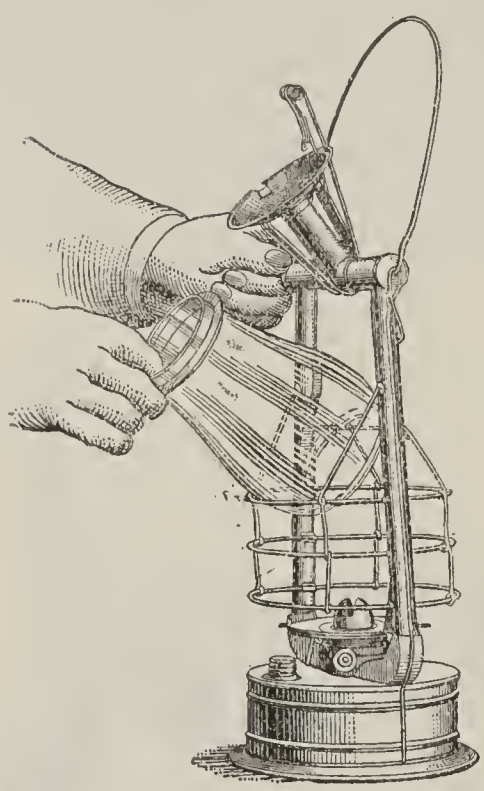

Fig. 1.—Non-Spilling Safety Lantern. —Removing Globe.

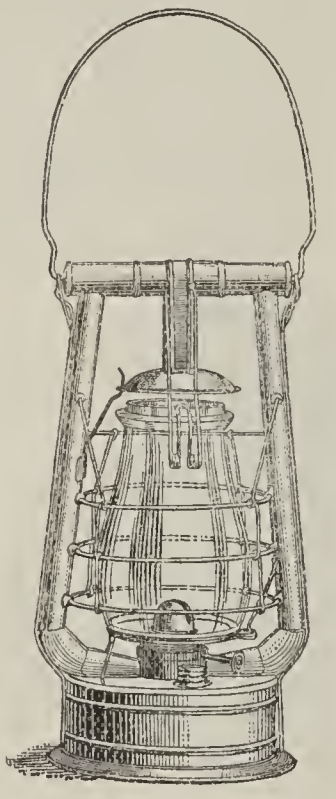

Fig. 2.—Lantern Ready for Use.

The lanterns are made of heavy stock, and the air tubes are large for admission of air to burner. The lantern is equipped with the Hermance non-spilling oil reservoir, which is said to keep the oil in the fount even if the lantern is upset, while upsetting the lantern when lighted, it is stated, causes the flame to be extinguished. The lantern here represented is known as the Hartford, single top, the company also making a similar lantern known as the Boston pattern with double top. We are advised that both patterns have been indorsed by the Factory Insurance Association, Hartford, Conn. A similar lantern for general use sold for a less price is made without guards. As will be seen by the cuts, the globe is readily removed for lighting or cleaning, while the burner may be as easily taken off by pressing a brass spring fastened to the side tube at the bottom of the lantern.

Ochsner & Orcutt Company, Sioux City, Iowa, have purchased the stock of Burns & Hunt of that city, which will shortly be removed to their large double store at 1010 and 1012 Fourth street. They are now remodeling the premises and putting in new and elaborate fixtures which will make the store an attractive and convenient one. The company's lines will comprise Builders', Shelf and Heavy Hardware, Stoves and Tinware, Bicycles, Sporting and Athletic Goods, Gun and Bicycle repairing, Stoves, Tin and Furnace work, &c. Their business is both wholesale and retail.

MEMORANDA.

Thomas B. Benson, many years ago one of the prominent stove merchants of Wilmington, Del., died recently at his residence after a lingering illness, aged 76 years. He was a member of Lafayette Lodge, A. F. A., F. A. M., and Delaware Lodge, I. O. O F. The funeral services were in charge of Lafayette Lodge, and the interment was at Newark Union Cemetery.

An error was made last week in noticing the new Refrigerator catalogue of the Dillingham Mfg. Company. They are located at Sheboygan, Wis., and not Michigan.

John Richey & Son succeed the firm of Wheeler & Richey, at Palestine, Ill., in the Stove and Hardware business. The new firm will erect a new building for their business as soon as the spring opens.

Geo. W. Brown, Jr., dealer in general Hardware, Stoves and Ranges, Hillsboro, Ill., has bought the Paden & Wilson stock of Farm Machinery, Buggies, Wagons, Pumps, &c., and intends to make this line a permanent addition to his stock. Mr. Brown would appreciate catalogues and other printed matter relating thereto.

E. B. Sutton, Whiteside, Ontario, Canada, dealer in Hardware, Stoves, Musical Instruments, &c., would like to receive catalogues, calendars, &c., covering general Hardware, Electric Machinery, &c., with information as to prices.

Nice & Hinkey, dealers in Hardware, Stoves, Tinware, Engineers' Supplies, Fittings, &c., Tonawanda, N. Y., advise us that they have no connection with a company somewhat similar in name, against whom a foreclosure suit is pending, the two concerns being entirely distinct.

George W. Graham, 28 Warren street, New York, has recently been appointed selling agent for the W. E. Thayer Mfg. Company, Williamsburg, Mass., for the Eastern territory lying between Philadelphia and New Haven, Conn., including both of those cities. This company, established in 1840, are manufacturers of a line of fine Tools and House Furnishing Goods, including Screw Drivers, Mincing and Kitchen Knives, Ice Mallets, Cake Turners, Awls, Nail Sets, Center Punches, Reamers, Countersinks, together with a number of kindred small articles. Later when the wants of this territory have been determined, Mr. Graham will carry a stock of goods for executing hurry orders.

Tobias Bros., retailers of Hardware, Stoves, &c., 1423 Main street, Peoria, Ill., have sold out to L. D. Putney. Mr. Putney expects shortly to increase the stock thus acquired.

Lane & Co. have lately opened up a new store in Lanes, De Witt County, Ill. They are carrying a stock comprising Shelf Goods, Tinware, Sporting Goods, &c.

C. E. Brigham has succeeded Brigham & Lyon in the Hardware line in Wauseon, Ohio, Joel Brigham and Marcus Lyon having retired. Mr. Brigham has had entire charge of the business for the past ten years, so that the change is practically one in name only. Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sash, Doors, Glass, Paints, Oils, Bicycles, &c., are carried.

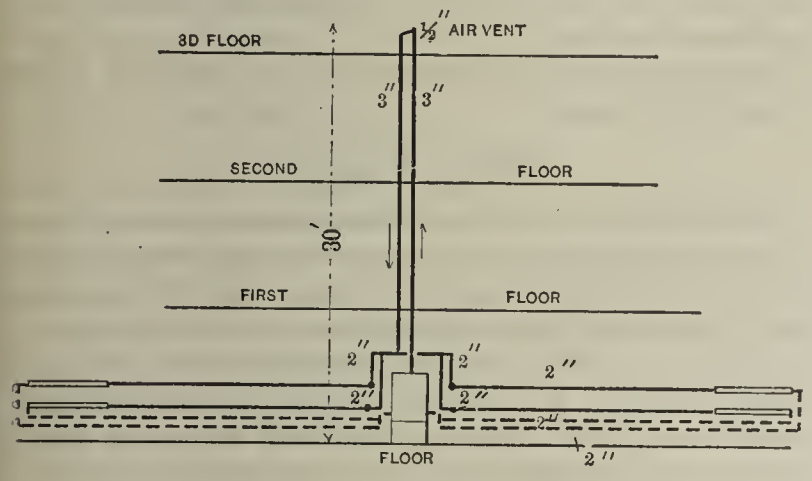
J. A. Marshall & Co., Manito, Ill., are making a number of improvements in their store, with a view to rendering it more convenient and attractive. They handle a large variety of goods, including Hardware, Tinware, Stoves, Implements, Seeds, Vehicles, &c.

J. C. Gafford has lately opened a new Hardware store at Salina, Kan. He is retailing Shelf and Heavy Hardware, Stoves, Tinware, &c.

Prowse & Pelton are successors to Prowse & Thomson in the wholesale and retail Hardware, Stove and Plumbing business in Herkimer, N. Y. The new firm are improving the interior of the store, making it more attractive and convenient

W. H. Chilson has purchased the Schneckloth Hardware stock in Garwin, Iowa, and will continue the retail Shelf and Heavy Hardware, Stove, Tinware and Sporting Goods business under his own name.

A. P. Cleland, dealer in Hardware, Steam Evaporators, Cane Mills, Pumps, &c., Macy, Ind., has put a new boiler in his machine shop, and is now better prepared than ever to repair boilers, engines, Bicycles, &c.



The recently completed warehouse of the Currie Hardware Company, Atlantic City, N. J., was destroyed by fire a short time since. The firm advise us that they are erecting a new store in which they will continue the wholesale and retail business in Shelf and Heavy Hardware, Stoves and Tinware and Plumbers' Supplies.

E. R. Hormel has succeeded Patrick & Hormel, retail Hardware, Stoves, Tinware, &c., Ulysses, Neb.

THE LETTER BOX.

Improving Circulation In a Hot Water Drier.

From W. C. O., Brooklyn, N. Y.—I would consider it a favor if you would give me your opinion upon the best method of improving the circulation in the apparatus outlined in the sketch sent herewith, Figs. 1 and 2 showing elevation and plan. The boiler cannot be lowered, neither can the coils be altered, as they run between endless rolls of paper in a drying machine. There are no

Improving Circulation in Hot Water Drier.—Fig. 1.—Elevation of Piping.

valves on any of the coils and both legs of the siphon are felted. I proposed to remove the felt from the drop leg of siphon and connect the return of the upper coils to the flow of the lower coils, thus compelling the water to pass through both coils. Is there any known way of erecting a plant of this kind under exactly the same conditions and without the siphon. The tenant has only one loft on the third floor of a building and finds a great deal of trouble in obtaining the permission necessary to run the siphon through other tenants' quarters. The flow outlet of boiler is 6 feet high, the return inlet 2 feet high, the upper coil 5 feet high, lower coil 30 inches high and the siphon 30 feet high, all hights being taken from the floor level.

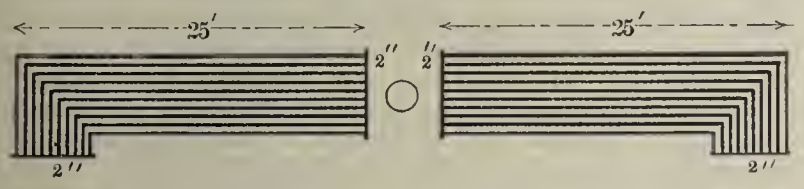


Fig. 2.—Plan of Piping.

The coils are 25 feet long and are made of manifolds and are laid on the side. They are miter coils with 2-inch return and 2-inch flow, and expansion tank is closed and works at 50 pounds pressure. The coils are graded perfectly, every pipe in the job having a grade of ⅛ inch to the foot. The main flow is 3 inches in diameter. The return outlets on the boiler are 2 feet high, and the return of lower coil runs in on a ⅛-inch grade to the boiler. The return of the upper coil was trapped 6 inches close to the boiler, evidently to check the circulation. I think it clears itself of air, however, as the boiler in filling expels the air back through the upper coil. There are no valves on any of the coils, as they are all operated at one time. The upper coil works well, but the lower one is very poor. I have examined the job very carefully and am unable to see any air pockets in the piping. The apparatus is used for drying purposes. Can you suggest any way of quickening the circulation on starting up, as it works better after it has been running a while ?

Answer.—The only point that would tend to make unequal circulation in the two tiers of coils is at the tee piece that feeds the lower coil. The size of the horizontal pipe that feeds the coils is not stated, but if it is the same size as the coil connections, it is a well-known law of a body in motion that it is disposed to continue in a straight line unless some force is applied to deviate or divide it. For this purpose the cross pipe from the 3-inch main should be large, say of the same size, 3-inch, with a tee piece 3 x 2 x 2. This forms a sufficient abutment to the motion of the water to give each outlet an equal pressure. The vent pipe from the top of the siphon may not carry away fast enough any steam that would reach that point by pushing the fire under the boiler for the supposed purpose of increasing the circulation. If steam remains at the apex of the siphon it will impede the circulation. There should be at that point a small chamber that would instantly give place to any steam that might rise to that hight and not allow it to choke the circulation, which it will do if it is carried into the down flow pipe. There is no better way for producing a good water circulation with the boiler on the same floor than the one our correspondent has. It is the main principle of the Baker car heater and works well when all the parts are well balanced. We do not recommend the removal of the felting. But changes to meet our suggestions as above will no doubt greatly improve the circulation and equalize the temperature.

Barstow Metal Lath.

From A. H. G. Hardwicke, 301 Main Street, Niagara Falls, N. Y.—Will some reader of *The Metal Worker* please inform me where the Barstow metal lath is manufactured ?

Steel Barrel Manufacturer.

From E. S., Kansas City, Mo.—Will some reader of *The Metal Worker* please tell me if there is such a thing as a steel barrel made, and, if so, what is the address of the company making it ?

Soft Solder for Metal Patterns.

From L. W. H., Ohio.—Can you give me a receipt for a good soft solder such as metal pattern makers use to put metal letters on patterns ?

Note.—We would be glad if some of our readers who are familiar with this work would supply the information asked for. In the meantime we will furnish a couple of receipts for soft solders taken from a reference book: A solder that melts at 180 degrees is composed of six parts of lead, one part cadmium and seven parts bismuth. Another solder, melting at 300 degrees, is composed of two parts of cadmium, two parts of lead and four parts of tin.

Tinners' Fire Pot.

From E. E. H., St. Louis, Mo.—Will *The Metal Worker* please inform me what is the best material, dimensions and shape for a tinners' soldering furnace to use charcoal for shop, and also for roofing in general outside work ?

Note.—We leave the answer to the inquiry of this correspondent to our readers. This is a season of the year when little is doing in the shop, and a discussion of the fire pot question, especially those adapted for indoor work and those adapted for outdoor work, with dimensions and sketches, will be interesting.

STOVE TRADE NOTES.

REVOLUTION AND EVOLUTION OF THE STOVE TRADE.

BY J. B. N.

The stove business has always been peculiar unto itself and not like the dry goods, flour, fruit, tinware or even hardware business. During the past seven or eight years it has been under the necessity of combining or cutting prices to the unprofitable line. Manufacturers of stoves have gone on in the even tenor of their way, doing their business quietly without fuss and making a fair and legitimate profit upon their sales, which, however, have not allowed any of them to live in the luxury that can be found in many other branches of trade that seemingly do not require any more brain or capital.

The stove trade weathered the panic of 1893 and hard and trying times since second to no other trade. It held its prices and did not go into that disastrous cutting found in other lines during those times to help tide concerns over difficult places. The tide of population moving West compelled some of our Eastern foundries to start branch foundries West in order to hold their trade and compete with Western foundries already there, as they could not manufacture in the East and freight the goods West and stand the competition. The firms who have done that have had the problem to solve of how, now that their production in their Eastern works was very materially curtailed, could they make the Eastern end pay. Running on quarter or half time they found was a losing operation, so after consulting and looking the field over very carefully one enterprising foundry decided they would make cheap goods for the masses and run full time and sell them at prices that would bring to them a large share of this trade. Of course this trade had been supplied satisfactorily before this foundry entered the field, so in order to capture the trade desired prices were cut on cheap grades of goods. They got what they were after, but hardly the result. It was not anticipated that very much attention would be paid to just one foundry doing that, but soon another loomed in the field from another direction, and then others and others, till now the competition and cutting of prices is absolutely ruinous to good business.

How has it affected the dealer? Is he the same? No; he, too, has had to change his method of buying. Where before he could buy about as he pleased, few or many, at about the same price, he finds now that if he will purchase a large quantity he can secure the minimum price, which always is an exceptionally low one, and he is consequently obliged to carry larger stock. Prices were kept normal all through the hard times, but now that good times are in sight the life is being cut out of prices in the struggle to get business. In this struggle only the strong who can fight and triumph in the "survival of the fittest" will be left to view the ruins.

It has now come to the stove trade to do and go through what other trades have gone through in the past seven or eight years—wipe out the weak and combine the strong; sell 12 stoves now at profit of four formerly; do three times the business and in the doing the devil catch the hindmost. It's the tendency of the period in which we live, that we must do more and get less than formerly. We must move faster, quicker. What was quick a year ago is slow to-day. Formerly a load of lumber was driven up to a building and unloaded by hand one stick at a time; now it is common to see the entire load hoisted up to the tenth or fifteenth story in less time than one stick could be handed up to the first floor before. The stove trade is new in this evolution and must think as it goes.

How about the credits when profits are so small?

How about the length of time allowed a customer to pay?

Are we burning the candle at both ends?

Has the retail dealer advanced as fast along these same lines as the foundryman? Does he not expect the same old concessions, and must they be granted?

Are the foundrymen being benefited by this change, now that good times are here?

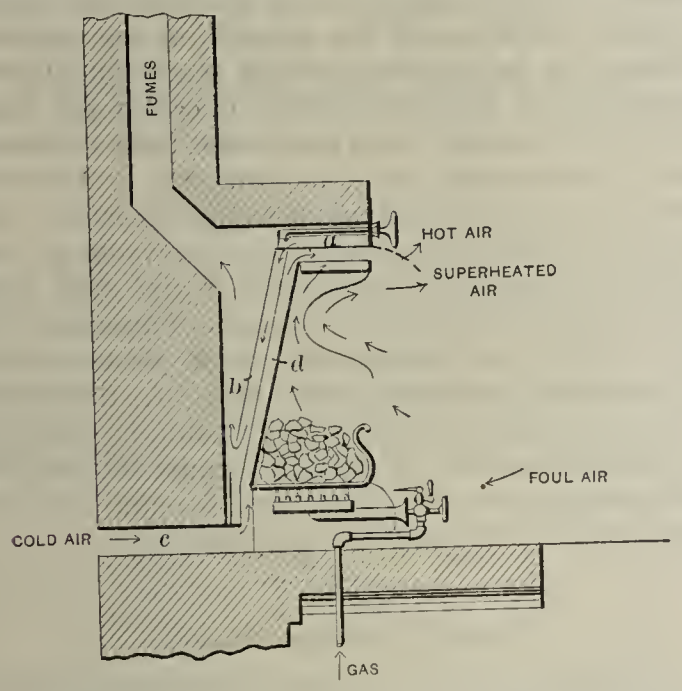
Does not the retail dealer get the same retail price, and is he not the fellow who is getting all the money and fun out of the ruin?

We cannot make the weather cold or hot, but we can sell goods at a profit.

Henry Francis.

Henry Francis, a pioneer stove manufacturer of Spring City and Royersford, Pa., died on January 17, at his residence at Spring City, aged 78 years. In 1865 he organized the firm of Francis, Buckwalter & Co., proprietors of the Continental Stove Works, Royersford, from which he retired in 1874. Mr. Francis was also interested in the Spring City Bloom Works. He took an active part in religious and philanthropic work and was never married.

New Process Gasoline Stoves.



The trade literature which is being sent out by the Standard Lighting Company of Cleveland, Ohio, is of an exceedingly attractive character. A week or two since we referred to their circular of New Process blue flame oil stoves, and we now acknowledge receipt of a finely printed pamphlet of 32 pages, relating to their New Process gasoline stoves for the season of 1898. In this catalogue the company call special attention to the completeness in detail of the various lines represented, reference being made to them as "embracing the largest variety of latest improved gasoline cooking devices which inventive genius and manufacturers' skill have as yet been able to produce." The New Process vapor stove is described at considerable length, both as regards its operation, its design and construction and its improvements. The latter include an improved controllable sub fire which readily lights in cold weather; an improved self cleaning feed valve which can be adjusted by the fingers to control the feed, no pliers, wrench or other tools being necessary for the purpose; an improved and efficient heat collector, whereby the inflowing air is said to be more quickly and thoroughly heated and delivered to the evaporator with increased force, and finally an improved tank connection to permit of the valves and pipes being readily cleaned. The frame of the New Process vapor stove is referred to as strong and rigid, the top of ample width and provided with removable grates. The burner drums are of burnished brass, the burner caps being removable. The valves are provided with needles having non-corrosive points, and the reservoir is of such construction that it cannot be filled when the stove is in operation. The tank is provided with a float which automatically equalizes and regulates the flow of the gasoline so that, the manufacturers state, the tank works as well with a small amount of gasoline in it as it does when full. All parts of the stove exposed to the fire are of cast iron, and all stoves are equipped with shield in front of hot air pipes. The catalogue shows a number of styles and sizes in which the New Process is offered, together with several varieties of the Bell Junior generating stoves and Globe Juniors. An illustrated description is given of the 1898 New Process valve, the 1898 Bell burner, while extended reference, accompanied by illustrations, is made to different styles of ovens for use in connection with vapor stoves. The company announce that as their patterns are changed from year to year it is absolutely necessary to know the year the stove was made for which repairs are wanted, and they suggest that dealers make note of this when ordering. Several pages are devoted to ventilated broilers, mammoth globe incandescent lamps, New Process oil heaters, wall torches, &c. The printing is well executed on a good quality of paper, and the binding is in colored paper covers with embossed side title.

HEATING WITH GAS.

BY J. H. KINEALY.

On account of its convenience, cleanliness and rather low cost, gas has come to be much used for cooking in almost all towns and cities having gas plants. Great attention has been paid to the design and manufacture of gas cooking stoves and ranges, in order that they may be made to burn the gas with little loss and to utilize as nearly as possible all of the heat developed by the combustion. The result is that in many cities it is now cheaper to burn gas for cooking than it is to burn coal. And in those cities where the price of gas makes it somewhat more expensive than coal for cooking purposes the excess of cost of gas is more than outweighted by the comfort of using it in summer time and its convenience and cleanliness at all times.

While a great advance has been made in the use of gas for cooking, the advance in its use for heating has not been nearly so great. Most of the gas heaters that have been devised and put on the market have been of the class that discharge the products of combustion into the air of the room being heated. Such heaters, of course, use the oxygen in the room, and vitiate the air to such a degree as to make it unhealthful if breathed for a very long time. Such heaters are therefore not suitable for rooms that are to be occupied continuously, and which have no other means of heating and ventilation than the gas heater. But they serve admirably for bathrooms or other small rooms that are not occupied at any one time for a very long period, or for rooms which are only partially heated by the gas heater, which is lighted during but a small portion of the day. These heaters are much more economical than they would be if they did not discharge the products of combustion into the rooms being heated,

Heating with Gas.—Fig. 1.—*Section through Gas Grate.*

as by doing this they utilize every bit of the heat evolved by the combustion of the gas. They are advertised as using but a small amount of gas and as being extremely economical.

So far as the writer has been able to find, there are but few gas heaters on the market that do not discharge the products of combustion in the rooms being heated, but into a chimney. And it is for this reason that the paper on "Gas as a Fuel," read by F. Foveaux, mechanical engineer with the San Francisco Gas & Electric Company, San Francisco, before the Pacific Coast Gas Association, is so very interesting. In this paper Mr. Foveaux describes a grate and a hot air furnace to be used with gas as a fuel.

Fig. 1 shows the grate. It is seen that the products of combustion pass up through the basket of the grate into the chamber *a*, and from there pass through the duct *b* into the chimney The air for ventilation passes through the opening *c* in the wall into the duct *d*, where it is heated by the hot products of combustion, and then passes into the room.

The hot air furnace is shown in section in Fig. 2. It is 40 inches in diameter and 72 inches high, and has six 7-inch outlets for hot air. The casing is double, with a space of from 1 to 1½ inches between the outer and inner lining, and is made of galvanized sheet iron. Inside of the casing there are 61 radiator tubes, each 2 inches in diameter and about 48 inches long, made of No. 24 or 26 sheet

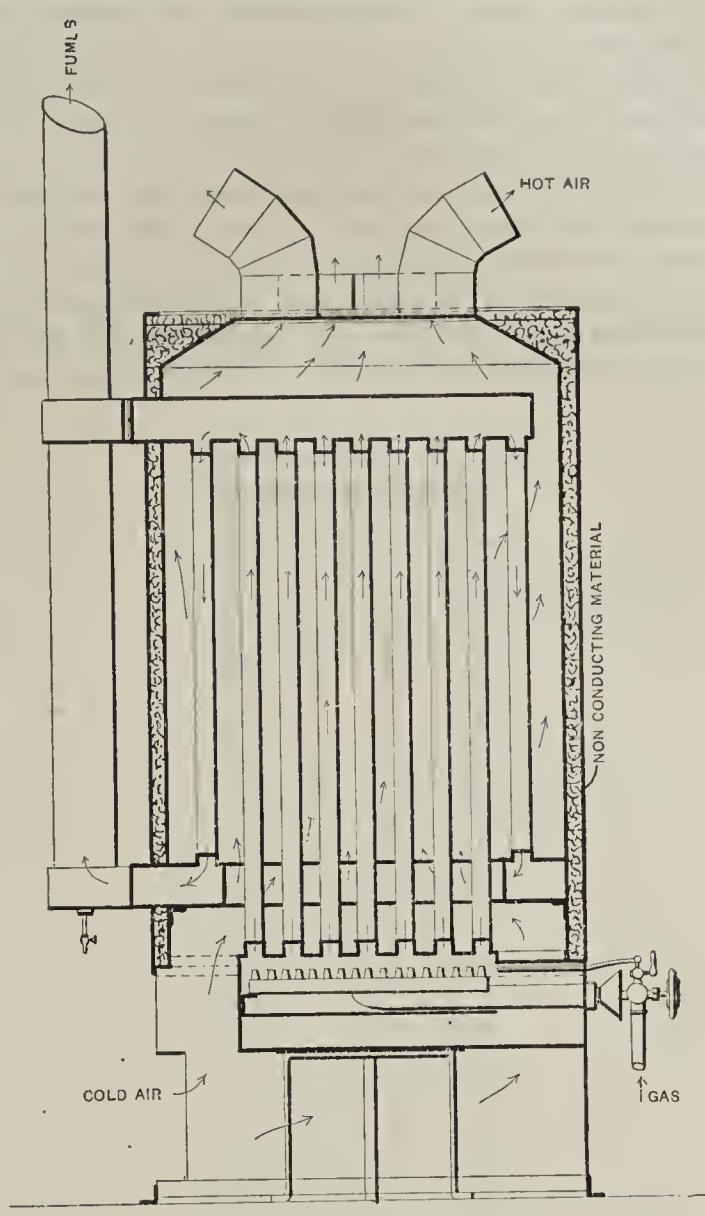


Fig. 2 —*Gas Hot Air Furnace.*

steel. As shown in Fig. 2, these tubes are connected at the top and bottom to hollow cast iron disks. The bottom disk contains the gas burners. The products of combustion pass up through the inner tubes into the top disk, and then down the outer tubes into a casting that is connected to the flue pipe. Cold air enters the casing at the bottom, and in rising to the top passes over the hot tubes and is heated by them. From the top of the casing the hot air is conducted by the hot air flues to the different rooms to be heated.

Mr. Foveaux says nothing as to the amount of gas that will be required for heating by the gas grate, but he says that "48 to 50 cubic feet of gas per hour will give the best satisfaction to heat six rooms" by the furnace. Of course "six rooms" is rather indefinite, and the amount of heat required to heat each will depend very much upon its size, exposure, and the kind and amounts of wall and window surfaces. We may, however, assume that six ordinary rooms are meant; that some have a north or west exposure and others have a south or east exposure; and that each room is about 14 x 14 x 10, and contains about 2000 cubic feet. On this supposition the six rooms would contain, in all, about 12,000 cubic feet. And if this can be warmed by the combustion of 50 cubic feet of gas per hour, it is evident that 1 cubic foot of gas is required per hour for every 240 $\left(\frac{12000}{50}\right)$ cubic feet of space in the rooms.

We may look at it still another way. The six rooms would probably require warming for 15 or 16 hours each day, and the gas used per day would be about 750 (50 × 15) cubic feet. The cost of this at 80 cents per 1000, which we pay in St. Louis for fuel gas, would be 60 cents $\left(\frac{80 \times 750}{1000}\right)$ and 60 cents per day would be $18 per month.

In the *Zeitschrift fur Heizungs, Luftungs und Wasserleitungstechnik* of November, 1896, there is a short article giving some of the results of experience with gas for heating schools in the southern part of Germany. The stove that was used, one of which was placed in each room, is shown in section in Fig. 3. It will be noticed that provisions are made for carrying off the products of combustion or fumes, for circulating and heating the air in the rooms, and for heating cold air introduced from the outside for ventilation. Just above the burner there is a cone shaped reflector which reflects heat down on to a polished cone reflector at the base of the stove. This last reflects the heat out into the room near the floor. It is stated that these reflectors aid very materially in preserving a uniform temperature throughout the rooms, and that when they were used there was a difference of but about 5 degrees F. between the temperature of the air at the ceiling and that of the air at the floor when the temperature at the ceiling was about 70 degrees. When gas stoves of a somewhat similar construction, but not provided with the reflectors, were used, it was found that when the temperature at the ceiling was about 70 degrees the temperature at the floor was only about 54 degrees.

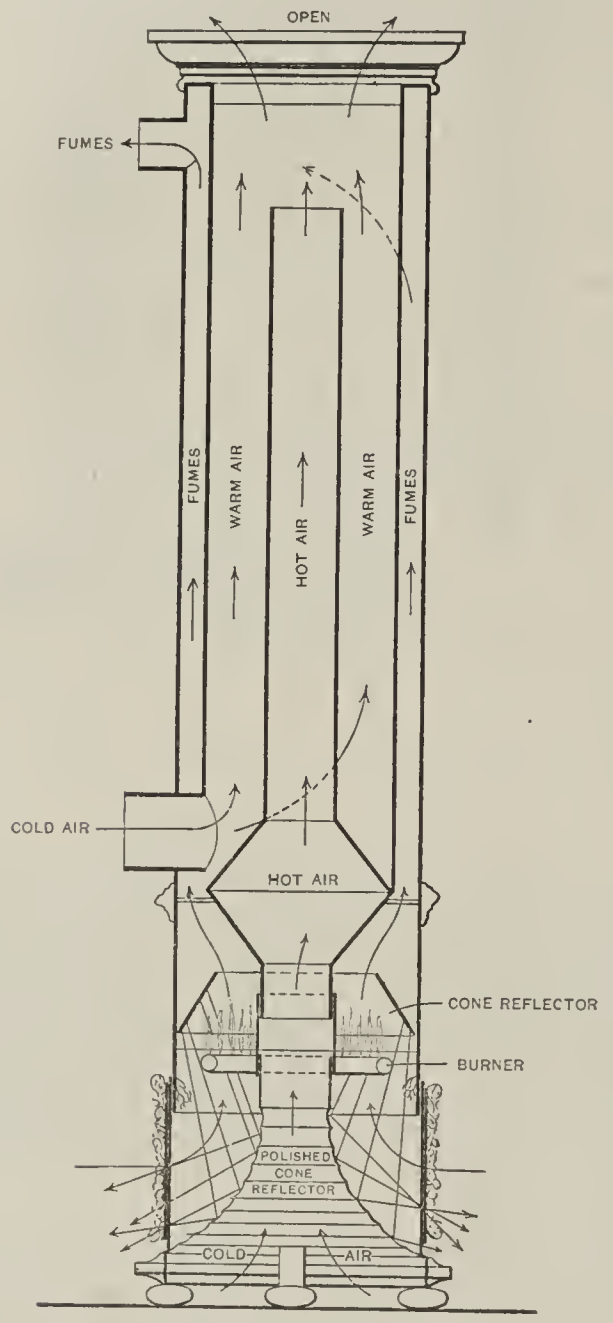

Fig. 3.—A German Stove.

From the data given in the article it is very difficult to arrive at the exact amount of space heated by the combustion of 1 cubic foot of gas per hour, as the number of hours the schools are heated per day is not given. It is stated, however, that about 31,000 cubic feet of gas were used to heat one room, containing about 7100 cubic feet, for the seven months from October 1 to April 30. It is probably safe to say that the gas stoves were in use eight hours per day for 26 days in each month, or 208 hours per month. Hence the total number of hours the stoves were used during the seven months is about 1456 (7×208). If we divide 31,000 by 1456 we get 21.3, which is the number of cubic feet of gas that was required per hour to heat a space of 7100 cubic feet. And if we divide 7100 by 21.3 we get 333, which is the number of cubic feet of space that was heated by burning 1 cubic foot of gas per hour. Then to heat six rooms, each containing 2000 cubic feet, there would be required about 36 $\left(\frac{6 \times 2000}{333}\right)$ cubic feet of gas per hour, or about 540 cubic feet per day of 15 hours. The cost of this at 80 cents per 1000 cubic feet of gas will be about 43 cents per day, or $13 per month.

Of course it is impossible to make any comparison, with the very meager data at hand, of the cost of heating by the furnace shown in Fig. 2 with the cost of heating by stoves similar to that shown in Fig. 3. It must be remembered that the costs given here are average costs per month for a season of about six or seven months; some months the cost would be much higher and other months much less. The kind and construction of the building, the thickness of its walls and its exposure are factors that would have a very important bearing upon the average cost per month of heating it by gas.

From what has been said it appears that when using gas at 80 cents per 1000 as a fuel, the cost of heating and ventilating six rooms, each about 14 x 14 x 10, would be somewhere between $13 and $18 per month. It is probable that the consumption of gas would have to be very carefully regulated in order to keep the cost down to $13 per month, and that is what most people would fail to do. The supply of gas to each stove or to the furnace would have to be regulated automatically to suit the requirements, in order to make the use of gas economical.

It is very much to be deplored that there is so little exact data obtainable as to the cost of heating by gas, as it is an important question, and one that is growing more and more important every day.

It ought to be possible to make a gas stove that would not discharge the products of combustion into the room, that would not occupy any more space than an ordinary hot water or steam radiator, that would not be unsightly, and that would permit the amount of air supplied for ventilation to be adjusted within reasonable limits. If one stove of this kind were placed in each room, and was provided with a small pilot light, kept lighted during the winter, a thermostat could be arranged so that the gas would be turned off or on as necessary to preserve a constant temperature in the room. Such a system of heating ought to be economical, and ought to give great satisfaction. The gas would be turned on and burned only when needed. When not needed the gas would be turned off, and the expense of heating would cease. At the beginning of the cold season the pilot light would be lighted, and then it would always be ready to ignite the gas when it was turned on, and the system would require little or no care or attention during the entire season.

Jewel Gasoline Stoves.

A beautiful catalogue of vapor stoves for the season of 1898 has been issued by George M. Clark & Co., 72 to 76 Lake street, Chicago. It comprises 40 pages of exquisitely fine letterpress and artistic engravings. The page is 7¼ x 8¾ inches in size, and therefore looks almost square. A cover of heavy paper is used, of a deep green color, which makes a good background for the embossed gold lettering and the Jewel Security trade-mark. The catalogue is printed in two colors, black for the letterpress and large cuts and chocolate for illustrations of burners, borders, head pieces, &c. The combination is effective and pleasing. The catalogue opens with views of the company's main offices in Chicago and their works at Harvey, which is a Chicago suburb. These works have 3½ acres of floor space and are admirably adapted to the purpose for which they are used. The company's manufacturing facilities are now unsurpassed.

The first stove to which attention is called is the Jewel Security, the new stove which they have been steadily working on for several years and have at last perfected. Its name indicates its character. The company claim that it leaves nothing to be desired for security in using gasoline for fuel. The immutable law of gravitation is relied upon for security instead of any mechanical device, which might at some time fail to act. For quickness of lighting, the 30 seconds or less in which this stove may be started are almost like turning a gas cock. The stove is free from odor at all stages of its operation and when the burners are turned out. It is built with a view to durability, and no needle valves are used. The Jewel Security

stoves are, in fact, gas stoves, as the gasoline is merely used in generating gas, and nothing but gas reaches the burners. The gas is heated and expanded before burning, and is therefore burned in the same state as that in which it is used in the Jewel Smokeless Generator stoves. This means that more heat units result from every gallon of gasoline than when the gas is used unexpanded and nearly cold. The Jewel Security stoves are made in two sizes. The larger size has three burners and a simmering burner on top with two burners on step, while the smaller size also has the step, but only two burners on top.

Next comes the Jewel Smokeless Generator. This construction has been on the market for some years and is one of the company's well tried and reliable products. On this principle they build a range in cabinet style and plain stoves in two sizes. The larger size has three burners on top, with an end step, while the smaller size has two top burners and step. The Jewel-Mammoth line is next in order. These stoves have smokeless burners having a large surface of flame. They are made in two hights of frame, 24 inches and 14 inches. The high stove is made in two sizes and the low stove in three sizes. The Jewel Junior line is then described. It is made in three sizes, individual burners being used. The Jewel Camp and Yacht stoves comprise two portable stoves, operated by air pressure secured by a hand bulb, and adapted to picnic or camping parties, yachting, &c. The Jewel-Acme line consists of a series of stoves furnished with the Jewel-Acme burner, which is an individual burner, smokeless in lighting and controlled by one needle. Constructions are shown with end steps, without steps, and in low stoves, 14 inches high, covering a full line. These stoves are made with lay down safety tanks or with stationary tanks, as desired.

Jewel Process stoves and ranges are last but by no means least. They are shown in several styles. The cabinet range presents a very handsome appearance. It has a horizontal tank, with valves independent of each other, removable and renewable valves, and a sub-flame which is designed to prevent flooding and secure perfect combustion. Step stoves are built on the same principle, with three and two burner tops, also a two-burner stove with no step. A number of pages forming the best part of the catalogue are devoted to supplies, such as Jewel baking ovens, steam cookers, toasters, broilers, flat iron heaters, waffle irons, automatic safety cans, &c. A strong point in connection with the Jewel stoves is that repairs of all parts can easily be obtained, as they are constructed on the interchangeable system.

Quick Meal Gas Ranges.

We are indebted to the Ringen Stove Company, St. Louis, Mo., for a copy of what is known as Catalogue No. 33, being a publication of 44 pages, bound in red paper covers, and illustrating and describing Quick Meal gas ranges, hot plates, gas furnaces, &c. In offering this publication to the trade the manufacturers present an announcement to their business friends to the effect that the new lines of Quick Meal gas ranges put upon the market during the last two seasons have met with very gratifying success, while the old ones have held their own. This, the company intimate, is good proof that their efforts to make the Quick Meal gas ranges perfect in every way are being duly appreciated. The catalogue shows a large variety of styles in which the Quick Meal gas range is offered, each illustration being accompanied by sufficient descriptive particulars to enable the dealer to obtain a good idea of the essential features of construction and claims made for the goods. Attention is also given to the Quick Meal upright broiler and water heater, and to a varied line of combination steel gas and coal ranges, running from a size adapted to the requirements of a small family up to those of a boarding house. The concluding pages of the catalogue are devoted to Quick Meal hot plates, gas furnaces, saucepans, bake ovens, broilers, sad iron heaters, waffle irons, toasters and Quick Meal gas burners.

"Twin Burner Gasoline Stoves and Ranges" is the title of a 32-page pamphlet, bound in paper covers, which reaches us from the Twin Burner Stove Company of St. Louis, Mo. The line of goods illustrated and described embraces, among others, Cabinet Process Stoves, which the manufacturers state have been greatly improved in appearance and serviceability and are offered in all styles and sizes. They are so constructed that the burner drums, which are of brass, hot air tubes and needle points are impervious to heat or rust. It is noted that the goods are new in design and elaborately nickeled, and being equipped with the Twin Burner patent odorless device are free from objectionable odor. Special reference is also made to the company's Jumbo Burner, which is said to be simple in operation and makes a very hot fire in proportion to the amount of fuel expended. The goods are shown in a variety of styles accompanied by brief descriptive text.

ODD PLATES.

The Progress Stove & Furnace Company of Springfield, Ohio, is the name of a concern recently incorporated at Columbus, that State, with a capital stock of $100,000. The directors of the company include S. W. Martin, T. D. Wallace, I. F. McNally, J. E. Adams and W. C. J. Randall.

The Toledo Stove Works of Toledo, Ohio, resumed operations January 4, with a full force of workmen, after a brief shut down for the usual inventory. We understand that the company closed a very successful year, the business for 1897 being stated to have been double that for 1896. The volume of orders now being received is of a very gratifying character and the prospects for a large output the ensuing year are considered good.

Isaac A. Sheppard & Co., Philadelphia, Pa., issue a somewhat novel announcement relative to the "warming of the house." This they say is not the least difficult problem connected with building a home, but is one which should be solved before the house is built. In fact, it should be planned while the house is going through the same process. The company intimate that a work which will help architects is their book entitled "Hints About Heating," this being a practical exposition of the problem of heating all kinds of buildings by hot air. It is written by an expert and contains tables and diagrams, and is intended to show the value of Paragon Furnaces as a heating apparatus. The new edition of "Hints About Heating," revised and enlarged, will be sent to any architect on request free of charge.

We understand that to facilitate the adjustment of family and other interests arrangements have been made for a reorganization of the Spicer Stove Company of Providence, R. I., and to this end there was placed on record on January 13 a trust deed transferring the property of the company to John R. Prescott, the present secretary of the Anthony & Cowell Company of that city. It is stated that the retirement of one of the partners and the death of another rendered certain rearrangements necessary, and the appointment of a trustee is a step in this direction. The business, however, will be continued on the same progressive policy which has always been characteristic of the concern. Mr. Prescott, the trustee, under whose management the business will hereafter be conducted, is well known to the trade throughout the country. He was for seven years connected with the Barstow Stove Company of Providence, R. I., and for 16 years was secretary of the Smith & Anthony Company of Boston, Mass. The business of the Anthony & Cowell Company is not affected in any way, Mr. Prescott continuing as secretary as heretofore.

The Toledo Stove Company of Toledo, Ohio, have just closed a contract for the year 1898 to handle in the territory west of Chicago the lines of Stoves and Ranges made by the Chicago Stove & Range Company of Chicago, Ill. We understand that this contract was a *bona fide* sale of the goods, and guarantees the purchase of a stipulated amount during the year on very favorable terms.

A neat little calendar for the new year, which is being distributed by F. Elwood Yeager of 56-58 North Second street, Philadelphia, Pa , is a card measuring about 7 x 10 inches and embellished with a reproduction of a water color design. At the top of the card is the statement that Stove Repairs are a specialty with Mr. Yeager, and that he also handles National Gasoline Stoves, New Era Blue Flame Oil Stoves, Heaters, Ranges, Ovens, &c. The leaves for the different months of the year are attached to the lower part of the card and are printed in a dainty style in keeping with the rest of the calendar.

"From the Mail" is the suggestive title of an exceedingly well printed and neatly bound pamphlet which is being distributed among their friends in the trade by the Schneider & Trenkamp Company of Cleveland, Ohio. The printing is done in two colors, the text appearing in a brown ink, while the illustrations are black. The matter consists for the most part of testimonial letters from some of the many customers of the company, the letters coming from all parts of the United States and showing in an unmistakable manner the satisfaction which the goods have given wherever introduced. The central feature of the pamphlet—which, by the way, is bound in red covers of rich design—is a double page illustration of a kitchen interior equipped with, among other things, the company's Reliable Steel Range and Reliable Gas Stove, the latter being represented in full blast. In offering this publication to the gas fraternity, the company refer to the testimonials as proving the national reputation of the Reliable Gas Ranges. Another interesting feature is the frontispiece, which is made up of excellent likenesses of Paul Schneider and Henry Trenkamp.

The Brotherhood Klondike Stove is the name of a construction which has been brought out by the Edward Miller Cornice & Roofing Company of 940 Railroad street,

Tacoma, Wash., to meet the demand for a Stove peculiarly adapted for use in Alaska. It is stated that those who have been in that country found that the ordinary camp Stove burned out in a few weeks, due no doubt to the fact that it is necessary to severely force it in order to obtain the requisite heat. The Stove made by the company named is a rectangular iron box of No. 18 steel, the fire box being 12 x 14 x 30 inches and having a down draft. It is said to be a powerful heater and will hold a fire for hours. The oven, which is square in shape, is detachable, and when not in use for baking serves as a warming oven or extension of the Stove. The arrangement of parts is such that in setting up the Stove dry sand, gravel or earth is placed in the upper chamber of the Stove and the same in the bottom of the fire box. The oven is hung on the Stove with the sand chamber in contact with it so as to heat the sand. When ready for baking the oven is placed on top of the Stove with the hot sand chamber uppermost. When moving about from one place to another the sand is thrown out, and refilled when a new camp is established. The Stove may be carried in compact space, the size being reduced to the dimensions of the main body, for the oven, legs, stove pipe, tins and baking pans can be placed inside and still leave plenty of room for provisions.

In accordance with a custom which they have followed for a number of years, Rathbone, Sard & Co. of Albany, N. Y., issue an Acorn calendar for 1898. It is of the same general style as those of previous years, except that the outer covers are silvered with printed matter in a deep red, forming a rich contrast. Each slip carries the calendar for two months, and also brief reference to Acorn Cook Stoves and Ranges. The calendar is very neat in its make up, and the one for 1898 will doubtless prove fully as popular as those which have been sent out by this enterprising house in past years.

According to newspaper accounts a number of farmers in Indiana were taken in by a new swindle which is going the rounds. Agents who were selling Stoves passed through that section not many months ago and disposed of Ranges to many farmers for $69 each, to be paid for at any time within ten years at 6 per cent. This was the verbal contract, and the paper which the purchaser signed was supposed to be an agreement to that effect. It turns out, however, that the papers signed were promissory notes for $69, due December 1, 1897.

At a meeting of the Board of Directors of the Keely Stove Company, Columbia, Pa., held on Tuesday, January 12, an annual dividend of 5 per cent. was declared.

The Scranton Stove Works of Scranton, Pa., resumed operations on the 17th inst. after a three weeks' shut down, during which time the usual inventory was taken and such repairs made as were found to be necessary.

The Chattanooga Stove Works of Chattanooga, Tenn., have been meeting with an unusually good demand for their products during the past three months, and the works are now running full time with an increased force of hands.

The Kernan Furnace Company, Utica, N. Y., have been awarded a contract from A. B. Brown, Buffalo, N. Y., who is building 50 houses for the Niagara Park Improvement Company of Buffalo, for 50 Hot Air Furnaces. They are to be installed by Edward Keuer, Jr., 400 Connecticut street, Buffalo.

F. H. Moore of the Howard Furnace Company, Syracuse, N. Y., after a visit to Boston was at their New York office, 231 Water street, this week.

Politics Versus Business.

Vice-President George H. Barbour of the Michigan Stove Company, Detroit, Mich., delivered a very interesting address Wednesday evening, January 12, at a dinner given by the Merchants and Manufacturers' Organization to its members. While the subject so interestingly discussed by Mr. Barbour is somewhat foreign to *The Metal Worker*, there was nevertheless a great deal of general interest that appeals to every one, whether in the stove, metal or other lines of business. The first part of his address was as follows :

No doubt many will differ with me in the discussion of this subject, but I feel that it is one that, at the present time at least, calls for a great deal of careful thought In my opinion, politics is a business as well a study, and if politicians would only consider it in this way when acting in any official capacity and not use their offices for selfish or personal gain to the detriment of the public at large, their power, in my opinion, would be more greatly felt. It has always seemed to me that a political official should treat the trust he represents the same as any good business man does the office he holds in any mercantile or manufacturing institution. To succeed in any business, I care not whether as a manufacturer or as a merchant, especial attention and care must be given to all the details. A good business man would not think of employing a bookkeeper for a general superintendent of any manufacturing institution, neither would he think of employing a mechanical expert to keep the books of the institution. A wise man will select the proper parties to fill the proper positions if success is to follow, but is this the condition that governs political offices? Are those who are best fitted for the positions always selected? Not so, but often to the contrary, not only so far as relates to city government, but State and national legislation as well. Often those unfitted for the positions are selected, and this all comes about through political circles—influences brought to bear that this or that man must have a certain appointment regardless of his qualifications. Desired results will not follow under such conditions. If a good business man were to treat the business in which he is engaged in the same way, it would only be a question of time when his business would be ruined.

I have always advocated, and have no reason to change my opinion now, that if we expect good government, appointments should be made from the standpoint of their ability to fill the positions, and especially should this be true in our city government. We are all interested in the success of our city and desire at all times that everything should be so managed that proper results will follow. The government of a city as well as a State or nation should be conducted entirely on business principles.

You may say in any city there are more or less directly interested parties because they may be large tax payers, or some other reason given, but I think not. The laboring man, the man of moderate means, the millionaire, if you please, are all equally interested in the good government of the city in which they live, and to bring about this condition politics should not be the dominating power ; business methods should largely take the place of politics. How long do you think a good business institution, conducted upon business principles, would last and be able to exist, if they were to allow such methods as govern in the building of some of our State and Government buildings? Do you not believe that if an individual capitalist had built our new Government post office, securing the very best architects at the start, watching the building as it was under way of construction, thousands and thousands of dollars would have been saved over the cost to the Government? And do you think it would have taken 10 or 12 years to build it? I think not, and I believe that our Government would save a great deal of money if, when they had buildings to erect, they would allow competition from the leading architects of this country and then have a committee of experts, to be appointed by the President, pass upon the plans submitted by the different architects, and the selection to be made by this committee. The contracts could then be put up for competition and stipulations made calling for the building to be completed within a certain length of time or a heavy penalty follow. I believe in this way a large amount of money could be saved to this Government over present plans.

Mr. Barbour then went on to speak of the street car mail service in the city of Detroit, and proceeded as follows :

There is one more question that I think has been lost sight of by politicians and citizens—our public servants do not have time enough to themselves. Take the Mayor of our city, if you please, as an example; most of his time is occupied in receiving visitors who are making appeals for this or that office either for themselves or their friends, and his time, from early morn until late at night, is occupied in this way. He has to be agreeable to every one, and then if he does not accomplish gigantic things and a vast amount of business he is blamed, whereas it is really the fault of the people that do not give him time to even think. I believe this is a great mistake, and that consent should be given by the general public for officials to close the doors of their private rooms at least two or three hours a day for the purpose of giving a little attention to business matters which are of the utmost importance.

Mr. Barbour closed his address by referring to the plan adopted by Mayor Josiah Quincy of Boston in forming what was spoken of as the Mayor's "Cabinet," this cabinet, whose function is purely advisory, consisting of representatives from the Associated Board of Trade, the Clearing House Association, the Chamber of Commerce, the Merchants' Association, the New England Shoe and Leather Association and the Real Estate Exchange, thus giving an advisory council composed of men in the closest touch with active affairs, and being unconnected with politics they are in a position to give the Mayor disinterested and wise advice.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Dealings have been on a somewhat larger scale, but chiefly between large consumers and importers direct. Thus far this month about 350 tons have arrived here, but a much greater quantity has passed into consumption, and the local statistical position is stronger, since, besides the inroads made upon spot stocks, there has been more or less change in the ownership of the 2950 tons afloat for this country. Wholesale prices have not moved to the extent that would seem to be warranted by the stronger statistical exhibits that have been made of late, but average somewhat higher and are very firm at the advance. Jobbers' quotations are unchanged, but are quite strong at 4½c. per lb. for small lots of Straits Pig from store. The smaller consumptive demand has been quite active.

Copper.—Home consumers are taking up a very fair quantity of various forms of the metal, but their purchases are small in comparison with export movement, the latter being quite up to the late average and sufficient to hold prices quite firm all along the line. About 3,000,000 lbs. or more of Lake Superior Ingot were sold during the week. Dealers' prices for small lots from store remain at about 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper.

John Stanton reports the Copper production in the United States and of the foreign reporting mines and United States exports as follows, in gross tons of 2240 pounds :

	Reporting mines.	Outside sources.	Total U. S. product.	Product foreign mines.	U. S. exports.
First half 1895....	70,612	9,100	79,712	42,484	34,215
Second half 1895..	84,885	6,600	91,485	43,674	30,507
Total 1895.....	155,497	15,700	171,197	86,178	64,722
First half 1896....	94,180	7,200	101,380	42,255	58,216
Second half 1896..	95,314	7,200	102,514	43,941	67,287
Total 1896.....	199,494	14,400	203,894	86,196	125,503
First half 1897....	103,651	5,000	108,651	44,263	64,870
January, 1897.....	16,937	700	17,637	6,595	9,651

Total 1897.....	204,206	11,900	216,106	88,270	129,210

Sheet Copper.—Rather more activity is noted in the demand for Cornice Copper and the amount of inquiry indicates a considerable volume of business in the early future. Meanwhile, although the run of orders is not yet of extensive proportions, a few good sized contracts for near by deliveries have been placed. Manufacturers, however, are not anxious to book orders for extended deliveries at the prices now ruling, as they look for better rates as the year progresses and the demand for manufactured Copper expands. Small lots of Sheet Copper from stock are quoted by retailers on the basis of 15c per lb., a figure which, however, is sometimes shaded.

Pig Lead.—Moderate sales only have been reported during the week, and the market remains in a flat condition, with negotiations not only confined to unimportant quantities, but moderate all told. Wholesale prices have weakened off somewhat. The large consumers are seemingly out of the market at present. Jobbing business in Pig Lead was rather better than in the preceding week, but is hardly up to standard. Small lots of American Pig are quoted by retailers at 4⅛c. per lb.

St. Louis advices are as follows : The market for Pig Lead has eased off considerably during the past week. The consumptive demand is not heavy, while on the other hand the offerings are quite liberal.

Spelter.—The market here remains in a rather quiet condition and prices are stationary, but firm in the absence of any pressure of offerings. Retail quotations for good Western brands in small lots are at 4.40c. to 4.50c. per lb.

St. Louis advices report the metal to be in much the same condition as last noted. Producers are offering freely at the lower rates lately ruling and find buyers for their surplus stocks without much difficulty.

Sheet Zinc.—No new features have been developed in connection with this material. Sales are of very ordinary type and prices display no variation. Jobbers quote 600-lb. cask lots at 5⅝c. to 5¾c. per lb. and smaller quantities at 6⅛c. to 6¼c.

Antimony.—There is about the usual distribution and prices are almost stationary at about 7¼c. for Japanese, 7½c. for Hallett's and 8½c. for Cookson's in retail quantities.

Nickel.—Sellers quote 38c. per lb. for small lots.

Aluminum.—The demand for this metal in its various forms is well sustained. No change has been made in prices, which are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—American Coke Plates, which have been selling in fair sized lots for future delivery, are the only ones that have cut any figure in the market in the past week in this locality. Other Plates have moved very slowly, except in a small jobbing way. Prices for large lots are somewhat weak, and recent sales are understood to have been put through at very low figures. More mills are in the market with offers of Plates for both near and future shipment, and some lively competition is said to be going on for the large canners' orders which are pending. Consumers are holding off in a very decided way. They seem to be waiting to see how the cat jumps in the negotiations now going on between the makers looking to a combination of interests. Some of the larger consumers are of the opinion that prices will go lower if the movement fails, but how that can be it is difficult to imagine, for, from all accounts, the prices now current for American Cokes and the cheaper Ternes are already well down to cost. In any event it is pretty well accepted that a large amount of material will certainly be required before long, which, with the orders now in hand, will give plenty of work for the mills for the next few months. As noted elsewhere in this issue, preliminary steps have been taken by the Tin Plate makers for a consolidation on the lines followed in the proposed Wire combination, and thus far there has been some encouragement. The number of plants is large, however, and the capacity for independent action of recalcitrant works under the lee of a consolidation is not easily measured. Jobbers' prices for small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but these rates are not infrequently shaded: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3 50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20 ,$4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are without change in price, and, outside of purchases by exporting packers, are only selling in a small retail way.

Chicago advices are as follows: Manufacturers report an unusually heavy business. Last year at this time orders for Tin Plates were very light, and factory warehouses were being filled merely to keep the men employed. Now orders have been so freely booked that it is difficult to find factories whose capacity is not covered well into spring, while manufacturers are actually being pressed for deliveries. It is rather remarkable under the circumstances that prices show no increase.

Sheet Iron.—A very fair amount of business is being done, considering the season, in both Black and Galvanized Sheets, and some of the mills are filled up for the next two or three months. The makers, however, are not disposed to sell for delivery beyond the first quarter of the year at the prices now ruling, believing that indications point to higher prices later on. Jobbers report a better demand for Galvanized Sheets from the smaller consumers. Their sales have been larger than of late, but considerable complaint is made of unsatisfactory prices. Small lots from stock are quoted at about 2.35c. to 2.40c. for No. 27 Common Black Sheets, and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: Numerous orders are being placed for both Black and Galvanized Sheets.

Some of the largest buyers, however, are making determined efforts to hammer prices, but manufacturers' agents insist that the mills are presenting a firm front, owing to the scarcity of Steel. Small lots of Black Sheets from stock are higher, being now quoted at 2.30c. to 2.40c. Galvanized, however, is selling at 80 and 2½ per cent. off.

Old Metals.—The market has a better appearance, there being more inquiry and more disposition to buy, but bids are below selling ideas, especially in the line of Scrap Iron, so that the amount of actual business has not been important. An exception is found in Scrap Brass, for which a brisk demand exists for export. Prices show but little change, although Scrap Lead is weaker, in sympathy with the decline in the Pig Lead market. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8½c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 3 c.
Zinc	per lb. 2½c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	4.50

CHICAGO REPORT.

Scrap.—A fair movement is in progress without material change in values. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.

Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—The condition of trade is unchanged. The ruling prices of carload lots of 12 tons minimum are as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	7.00	7.25
Council Bluffs, Iowa	7.00	7.25
Lincoln, Neb	7.15	7.40
Sioux City, Iowa	7.50	7.75
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.65
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.00	7.25
Davenport, Iowa	6.30	6.65
St. Joseph, Mo	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb	7.00	7.25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

Some parties formerly connected with the Riverside Mfg. Company, Connellsville, Pa., have commenced the construction of a new plant which will probably be in operation in February. The new concern will manufacture Copper Ingots, Brass Ingots, Pig Lead and Spelter Plate.

THE HARDWARE TRADE.

It is evident that in many sections of the country the year's trade has opened with exceptional promise, the jobbers, especially in the West, reporting an early and more active business than usual. There is also a more hopeful tone in the market generally, as indications point to a large business in Iron and related products. In Builders' Hardware and Mechanics' Tools, which have felt so severely the effects of the business depression during the past few years, there is also a better demand, and increased activity in these lines may be counted upon if the present promise in regard to building operations is realized. In the matter of prices there is little new to report, and the market can only be characterized as steady, with slight indications of weakness in some lines. It is, however, on the whole, unquestionably quite well maintained in view of the usual dull months through which the trade has passed.

Advices from Chicago.—The movement of Shelf Hardware is larger than ever before known in January. Jobbers say that floor room is at a premium for laying out orders, which are not only numerous but of good size. Retail merchants are buying general assortments. New stocks are also a feature of the trade at present. It is somewhat singular that the country trade is not stimulated in Wire products, owing to the expectation of the early consummation of the Wire consolidation, but no speculative buying is apparent. The demand for tinners' stock and metals is not very heavy at present, but this is customary in midwinter, when the roofing trade is naturally quiet. The demand for Heavy Hardware continues very satisfactory. Collections are good.

Advices from St. Louis.—The Hardware jobbing trade report a continuance of the heavy demand noted in our last report. Dealers seem to have waited until the turn of the year, and are now sending in their orders, which call for more liberal quantities than the jobbing trade have been accustomed to receive at this season of the year for some time past. The demand for Shelf goods is particularly heavy, and gives promise of continuing so. The weather has not been sea sonable for the past two or three weeks, so that the demand for cold weather goods shows some falling off, but this is more than made up in the demand for other lines. Collections are very satisfactory.

NOTES ON PRICES.

Wire Nails.—There continues to be a fair demand for Wire Nails, but merchants are not purchasing speculatively to any great extent. The manufacturers are firm in maintaining prices and, for the most part, in refusing to accept orders for delivery later than February 28.

Advices from Chicago.—Large buyers admit that none of the manufacturers are showing any weakness. Prices are not only very firm, but the factories seem well sold up for the next 30 days. Jobbers are continuing to sell at old rates, but it is probably only a question of time when they will be obliged to advance their prices. Jobbers' prices for small lots from stock are $1.60 and $1.55 for carloads.

Advices from St. Louis.—The market continues to maintain the strong position noted in our last issue. Mills are not disposed to sell for future delivery even at advanced prices. The demand is excellent for this season of the year, and both mills and jobbers report a very satisfactory trade. Jobbers are asking $1.65 to $1.70, base, for small lots from store.

Cut Nails.—There is little new to report in the Cut Nail market. The volume of business is fair, and a hopeful tone pervades the market in regard to the demand during the next few months.

Advices from Chicago.—The demand for Cut Nails is sluggish, with small lots maintaining the old price of $1.45.

Advices from St. Louis.—There is no improvement to note in this department. Jobbers are asking $1.40 to $1.45, base, for small lots from store.

Barb Wire.—Manufacturers are refusing to accept orders except for delivery the next month or two. It is generally expected that the volume of trade during the coming season will be exceptionally large, and the manufacturers are refusing to have their books encumbered with orders which might interfere with the carrying out of the plans for the consolidation of Wire interests.

Advices from Chicago.—This trade is in the same condition as reported last week. A heavy demand is being received not only for Barb Wire, but also for Woven Fencing. Large contracts are also being placed for Plain Wire. Jobbers' prices are unchanged at $1.60 for Painted and $1.90 for Galvanized Barb Wire in small lots from stock.

Advices from St. Louis.—A very excellent trade is reported by both manufacturers and jobbers. The demand has set in earlier than usual and gives promise of being exceptionally heavy. Jobbers are asking $1.70 for Painted, with the usual advance for Galvanized.

Smooth Wire.—There is a somewhat increased movement in Smooth Wire. Quotations remain as before.

Wrought Iron Pipe.—At a meeting of the manufacturers of butt and lap welded Wrought Iron Pipe, January 14, a series of new base discounts were adopted, similar to those in force before. The following are the base discounts now in use: Small Black Pipe, 57 per cent; Small Galvanized, 50 per cent.; Large Black, 67 per cent.; Large Galvanized, 55 per cent.

Boiler Tubes.—The Boiler Tube market is referred to as very firm with a heavy demand, prices showing little, if any, change. Sizes 2 and 2¼ inches in diameter are 72½ per cent. off; 2½ to 6 inches in diameter are 75 per cent. discount.

Molded Wiping Cloth.—The price of Porsch's Molded Wiping Cloth, manufactured by John Porsch, 1222 Peach street, Erie, Pa., and which is illustrated and described in another column in this issue, is $1.

HEATING AND PLUMBING NOTES.

The contract for furnishing the Heating and Ventilating Apparatus for the new High School at Tonawanda, N. Y., has been let to Machwirth Bros. of Buffalo.

Lawrence E. Milyea, the plumbing inspector of Salem, Mass., has been tendered a banquet by the journeymen plumbers.

An effort is being made to organize a master plumbers' association at Taunton, Mass.

David Bloomfield has been re-elected plumbing inspector of Meriden, Conn.

Plumbers are well represented in the officers of the Builders' Exchange of New Haven, Conn. Robert Morgan is president and C. Elmer Dibble secretary, and A. H. Buckingham is one of the trustees. The retiring president, S. E. Dibble, a well-known plumber, has been a prominent factor in the success of the exchange.

The Kelly & Jones Company of Pittsburgh, manufacturers of Plumbing, Gas, Steam and Oil Well supplies, with works at Greensburg, Pa., have recently opened offices in the Perry-Payne Building, in charge of W. H. Bosworth.

Henion & Hubbell, 61 to 69 North Jefferson street, Chicago, are distributing with their compliments a very convenient pocket diary or daily memorandum book brought out by the Deming Company, Salem, Ohio, for whose Pumps and Well Supplies they are Western sales agents.

Announcement is made from St. Paul, Minn., January 17, that Joe Michel has bought the business of McDonough & Bowers, James T. McDonough, agent; Theo. Michel, trustee, 747 Wabasha street. The firm who deal in Hardware, Tinware, Stoves, Mechanics' Tools, Cutlery, also are plumbers, tinners and steam fitters, and the business will continue as James T. McDonough, agent; Joe Michel, proprietor.

At the last meeting of the Bayonne, N. J., Board of Health a committee, composed of John Howe, Walter Warden and J. J. Devanney, from the Master Plumbers' Association of that city, appeared before them and requested that some action be taken in reference to unlicensed plumbers from out of town doing work in the city to the disadvantage of plumbers who furnished a bond of $2000 for the protection of the city against bad workmanship.

Robert Drysdale, Westerly, R. I., is making extensive improvements in his plumbing shop and has a fine display of high grade Plumbing Goods.

John Erikson of Providence, R. I., has invented and is putting on the market a Gas Stop Cock designed for use in hotels, whereby turning on the gas without lighting it will give an alarm, the object being to prevent suicide from gas asphyxiation.

The Metal Worker acknowledges the receipt of an invitation from the Master Plumbers' Association of the City of New Haven, Conn., to attend the banquet to be tendered to the members and guests of the Connecticut State Association of Master Plumbers, at Tontine Hotel, New Haven, Conn., February 16, 1898, at the close of the State convention.

A unique folder, bearing in embossed letters the words "Twentieth Century," is received from Morgan & Co., 40 Dearborn street, Chicago, Ill., and presents illustrations and drawings showing the Twentieth Century Steam and Hot Water Boiler in its latest and most improved form.

The Board of Aldermen of Denver, Col., have been presented with a series of resolutions by the Plumbers' and Gas Fitters' Union asking for action to prevent department stores from making bargain specialties of Plumbers' and Gas Fitters' Supplies.

"The Sole Heat Retainer, a device to save one-half your coal bill," is the title of a little pamphlet in red covers issued by W. R. Fay, Galesburg, Ill., in reference to his Pipe Covering for steam, hot water and furnace pipes, which can be readily applied and is said to be highly effective in use. It consists of a preparation made of asbestos paper and mineral wool fiber, designed to be put on the pipe with a chemical paste, and can be applied when the pipes are warm or cold. If put on when they are warm it hardens quickly and is then ready for a canvas protection. When put on cold pipes a longer time is required for the covering to harden. A feature of the pamphlet is the numerous testimonials from those who have used it with good results. A half-tone engraving is presented of the Union Hotel, at Galesburg, Ill., in which the pipes are covered with the material furnished by Mr. Fay.

E. S. Wheeler & Co., New Haven, Conn., and 194 Front street, New York, inform us that they have some goods that will interest the plumber who uses open lavatories of modern construction.

It is expected that Brass Goods of the bib and Fuller work type will be advanced in price at the meeting of the Brass Goods manufacturers soon to be held in Buffalo, N. Y.

Hugo Ehrenburg of Hamburg, Germany, is visiting the United States and is interested in our methods of heating. He is stopping at the West Shore Hotel, New York.

Henry S. Downe, the manager of the London office of the American Radiator Company, Chicago, is enjoying a short visit at home. He will sail for London next week.

J. C. JONES, Newark, Ohio.

Special Notices.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice**, or with proper parties would be willing to retain an interest in the business if desired. For further information address

"STOVES,"
office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

Register For Sale.

The patentee of a new Improved Dustless Register wants to either sell same or interest manufacturers who can make same. This register can be manufactured 8 to 10% less than any other register on the market and has strong selling points over any other.

A. L. CANFIELD,
284 Pearl Street, New York.

OWING to the death of the proprietor, a Stove, Heating, Plumbing and House Furnishing business is offered for sale, in Claremont, N. H. A growing manufacturing town of over six thousand inhabitants. This is a first-class opportunity for any one wishing to engage in this business.

A. C. STONE, Administrator,
Claremont, N. H.

FOR SALE.

A good clean, well assorted stock of Hardware, with Plumbing and Tin Shop connected and commanding the best trade in town. Competition consists of one other hardware store. Located in Central New York State in a town of about 7500 inhabitants, having the trunk lines of railroad, paved streets, electric lights, electric street cars, water works, good schools, etc. Stock and fixtures will invoice between $7000 and $8000. Annual sales average about $25,000. This is a rare chance for a cash buyer. Address "RARE CHANCE," office of *The Metal Worker*, 232-238 William St., N. Y.

Stoves.
Iron and Steel.

THIS volume has been compiled from the extended series of articles in *The Iron Age*, on the arrangement of Hardware Stores, and contains a large and varied mass of information in regard to store arrangement.

A chapter is devoted to each subject and all are fully illustrated.

The summary of contents will convey an idea of the wide scope of the work, which treats of almost every subject connected with the arrangement of Hardware Stores.

Every hardware merchant should have a copy.

DAVID WILLIAMS COMPANY, Publishers,
232-238 William Street, N. Y.

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

J. L. PERKINS & CO., - - 243 Lake Street, Chicago.

—"LAW NOTES" tells a story of a young lawyer who asked a country Justice for a capias. The Justice did not know a capias from a police cell, but he disliked to admit his ignorance. So he said: "Now, see here, my friend, you are a young lawyer, and I fear lack experience. I would advise you not to be too hasty. Don't be in a hurry. Wait twenty-four hours, and then, if you think best, come to me and I will give you a capias." The young lawyer agreed and went away. The Justice spent the remainder of the day getting acquainted with the writ called capias. When the limb of the law appeared the next morning the Court felt himself qualified to issue capiases by the bushel. Before he could speak the young lawyer said: "Mr. Justice, you were right; I was too hasty. I have to thank you for the good advice, and also have brought you the $2 fee you would have received for the capias, as I don't want you to lose anything by your good deed." He went away believing the Justice to be a paragon of good sense and legal lore.—*N. Y. Tribune.*

—IN TRAINING.—"I'm going to be a contortionist when I grow up," said little Johnnie, proudly; "I'm in training now, so I want you to tell me what is the best thing for me to eat."

"Green apples, my boy," chuckled the old man.—*Demorest's Magazine.*

Factory at GERMANTOWN JUNCTION, | *Office and Stores, 231 and 237 ARCH STREET,*

PHILADELPHIA.

It's strange

how people run after cheap goods. And yet half the time they are encouraged to do so by an army of dealers who carry and push stock which appeals only to cheap trade Selling trashy goods generally means small profits. You can't make much money on poor tinware, and a little sound talk will always convince a customer that a better article brings true economy in its wake. *That better article,* when made from GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, becomes representative of the highest grade of perfection in the tinners' art, and may always be *guaranteed* to outlast any similar article made from other plates.

GUMMEY'S ANTI-PIN HOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

GUMMEY, McFARLAND & CO., Philadelphia.

Anchor . . Ventilators

—GRUESOME, TRULY.—A poor man lay dying, and his good wife was tending him with homely but affectionate care. "Don't you think you could eat a bit of something, John? Now, what can I get for you?"

With a wan smile he answered, feebly: "Well, I seem to smell a ham a-cooking somewheres; I think I could do with a little bit of that."

"Oh, no, John, dear," she answered promptly, you can't have that. That's for the funeral."—*From the Weekly Telegraph.*

ELBOW CHART
—FOR—
TIN and SHEET IRON WORKERS,
Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

DAVID WILLIAMS COMPANY,
232-238 William Street, New York.

—AN EVEN BREAK.—In a country town in Kentuckey there is a store where they sell "'most everything," including bicycles. The young man who does the selling intends to be a brilliant hand at repartee some day. Meanwhile he practices on the patrons in general, with a preference for colored patrons. An old "aunty," with a mellow fifteenth-century finish on her cheek bones, came in one market day and inquired: "You 'ain't got no cheap bicycles fer dat boy ob mine, is you?"

"I didn't say I hadn't, aunty," replied his smartship.

"Well, you needn't be so smart, mister. I 'ain't arst you isn't you; I arst you ain't you. Is you?"—*The Wheel.*

TABLE OF ALTITUDES
OF
SHEET METAL ELBOW PATTERNS,

giving the height (from *d* to *e*) of all required sizes, angles and number of sections. No confusing explanations, problems or devices. Simple as an interest table or ready reckoner. Free-hand and detail pattern drawing in Illustrated supplement. Cloth bound, 50 cts., mailed.

THOMAS ROONEY, Lockport, N. Y.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials —13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections) —325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

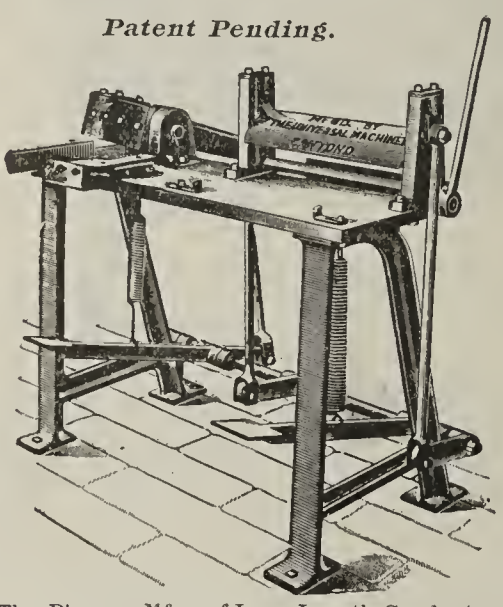
Metal Laths.

Sheets 27x96 inches.

The stiffest and most economical lath on the market.

Requires less mortar to make a perfect key than any other lath made.



Much cheaper to apply than either wood or wire laths.

LYON, CONKLIN & CO.,

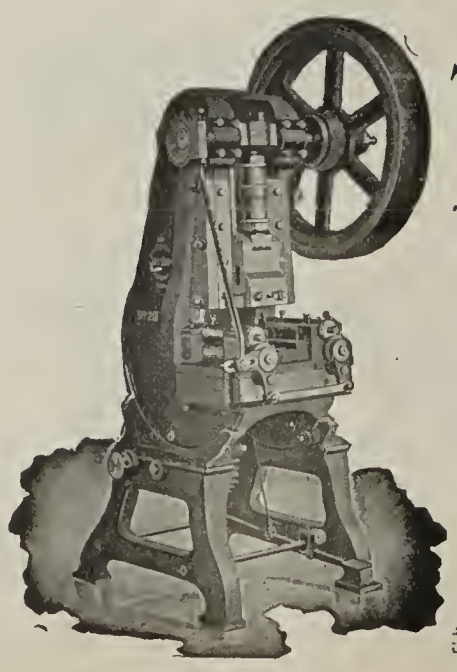
BALTIMORE.

ESTABLISHED 1860.

Patent Pending.

The Pioneer Mfrs. of Long Length Conductor Pipe and Eave Trough Machinery.

Make Money



By using the **Universal Slip Joint Machine** in connection with any Eave Trough Machine if you have one; if not, get a good one from us.

This machine does the cutting, folding and closing of Slip Joints either attached to or separate from Eave Trough and **saves nine-tenths of the labor** and does better work.

Remember also, we are manufacturers of **Beading Rods** of all kinds.

DESIGNERS AND BUILDERS OF

TOGGLE DRAWING PRESSES, DROP HAMMERS, GANG SLITTERS, ADJUSTABLE POWER PRESSES, PUNCHING PRESSES AND DOUBLE SEAMING MACHINES FOR WORKING SHEET METAL.

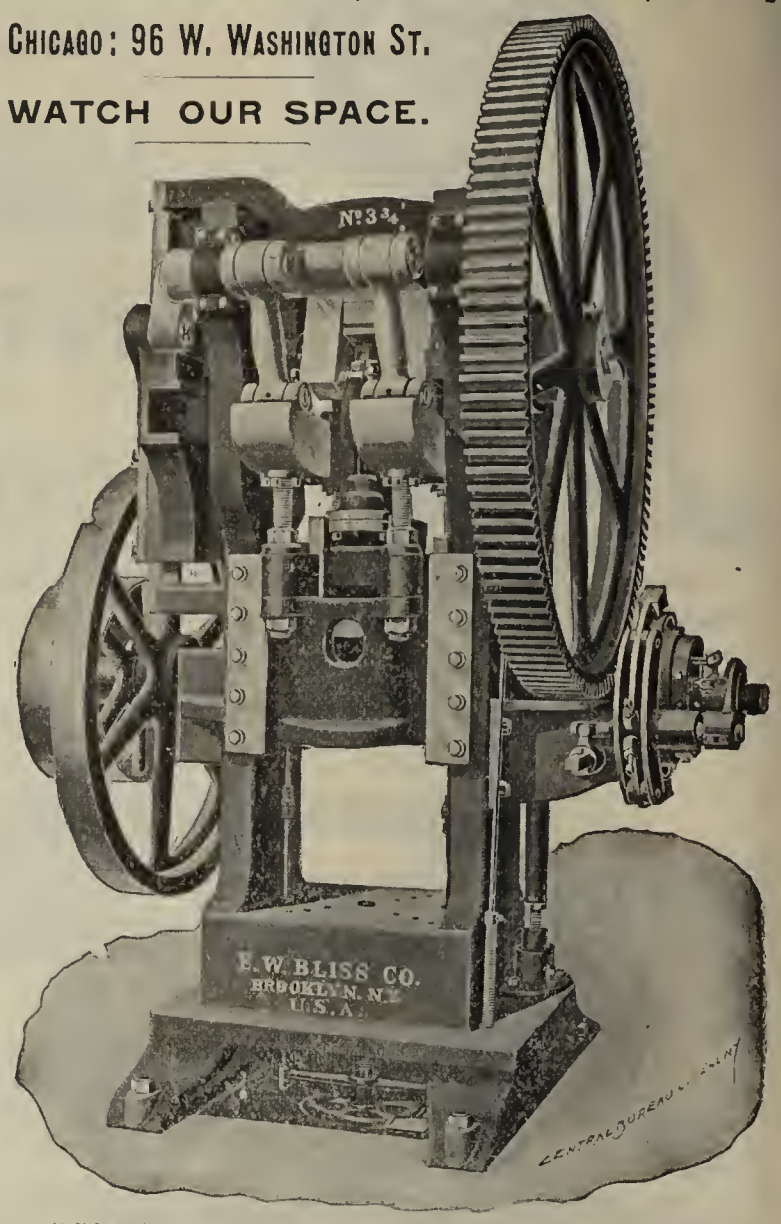
Award for Toggle Drawing Presses

At the Chicago Exhibition, 1893, Reads as Follows:

Two rockshafts, one on the front and one on the back of the press frame, are used, to which the blank holder slide is connected by means of toggle links. These rockshafts are operated from the main shaft by a peculiar system of link work which imparts through the blank holder a uniform pressure to the blank. The strain arising from pressure put upon the blank is fransferred through the straightened toggle directly to the frame of the press, thus relieving entirely the bearing from all friction and wear due to the blank holder and insuring smooth work, great durability and less consumption of power. The automatic friction clutch on these presses acts practically instantaneously and avoids entirely the heavy shock which tends to destroy the clutch parts.

A TESTIMONIAL.

From **HABERMAN MFG. CO.**, Manufacturers of Tin and Enameled Iron Ware
NEW YORK, Dec. 30, 1895.



* * * * * * We would say that we have used cam drawing presses of several makes and designs, and find none of them equal to your toggle drawing presses for accuracy and speed of production, or for convenience and solidity of construction.

YOU'D BE OUT OF BUSINESS

now if you only sold once to a customer. The money you make out of your business is made by selling to the same people over and over. Not all the money you could possibly make out of one sale would pay you for what you would lose if you sold a customer an unsatisfactory range or furnace.

It pays twice to sell Excelsior Ranges and Paragon Furnaces—
It pays in your profit.
It pays in your customer's satisfaction.

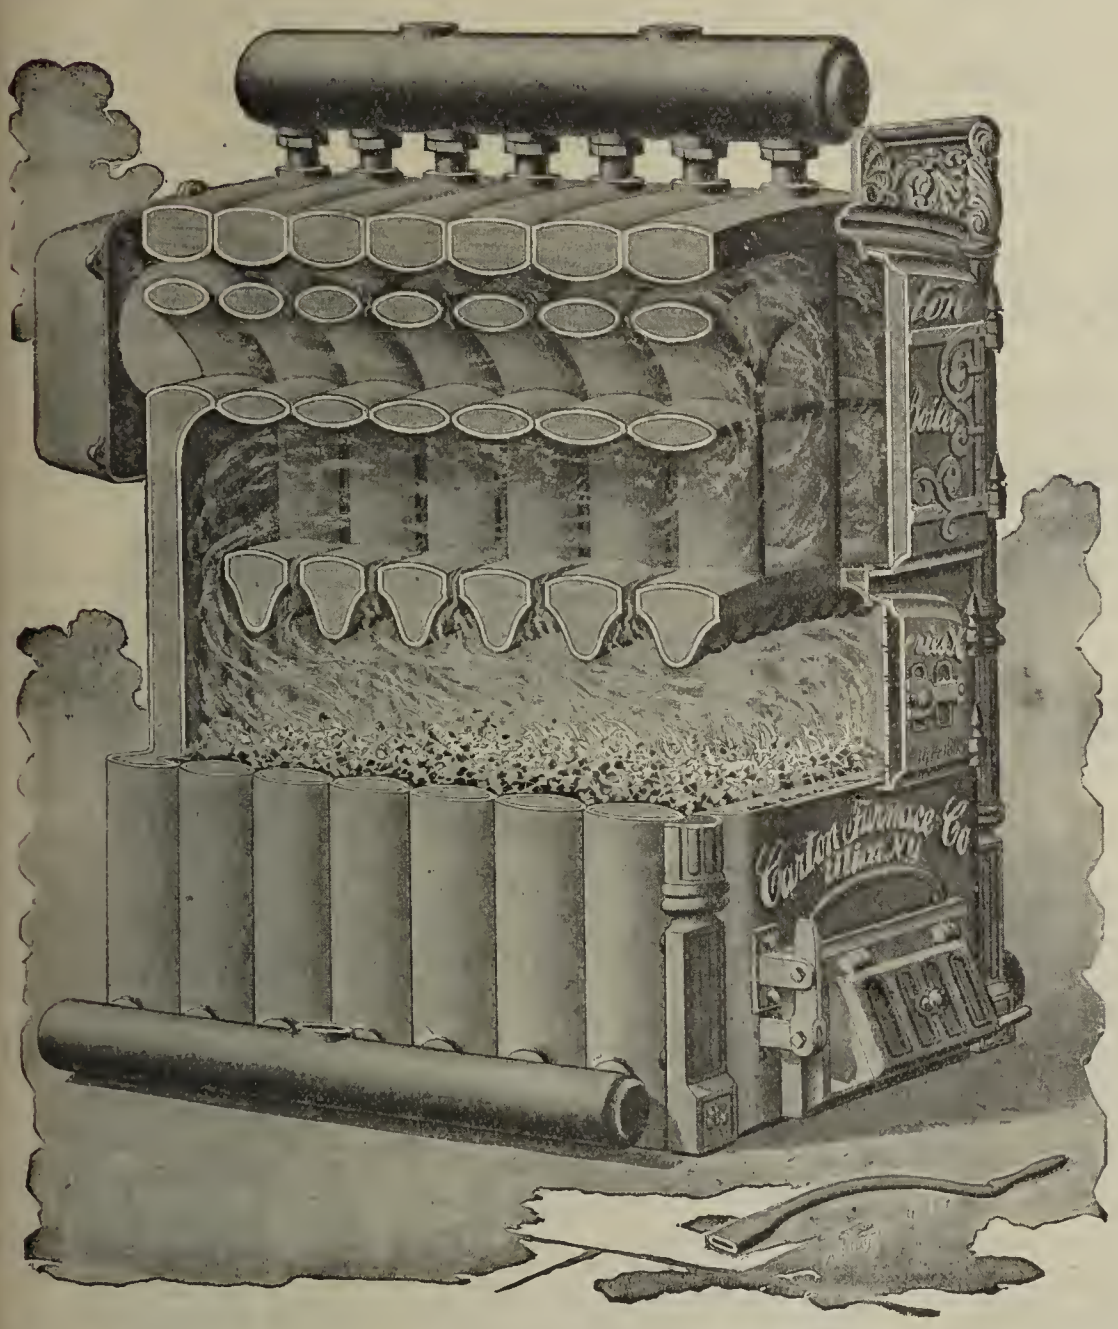
QUICK MEAL

BLUE FLAME OIL STOVES.

"Quick Meal" Blue Flame Oil Stoves met with deserved success in 1897. That was their first year. For 1898 they are much improved in operation as well as in appearance. The Flame will not grow too high when the Burner becomes heated and it will readily go out when the wick is turned down. The wick raising mechanism is more effective and simple than before. One of the Burner Drums is made of polished Brass, the ends of the Brass Tank (the parts that show) are also polished. All of this greatly improves the appearance of the Stove.



Sales on Quick Meal Steel Ranges have DOUBLED in 1897. Do you keep it? If not, you do not keep the "Best."

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR :
In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal
Very truly,
I. N. EVANS.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

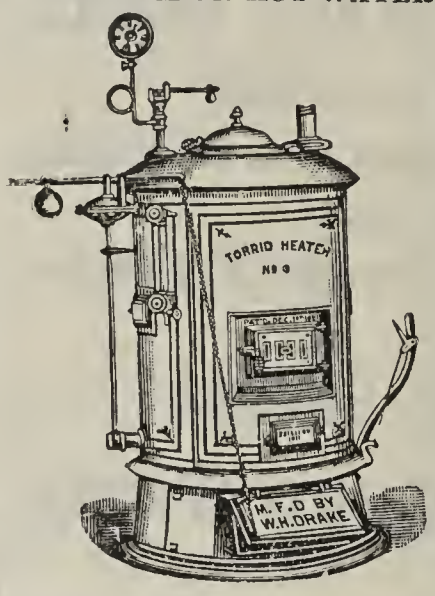
This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.



CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.

—An old gentleman in Lewiston, Me., now believes in miracles. He has had a great desire to own a hive of bees, and not long ago one of his neighbors promised him the bees, providing he would secure the empty hive. He accordingly did so, and left it standing on the piazza over night. What was his surprise in the morning to find his beehive occupied by a stray swarm that apparently came to him or were sent to gratify his earnest wish.—*Kennebec Journal.*

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

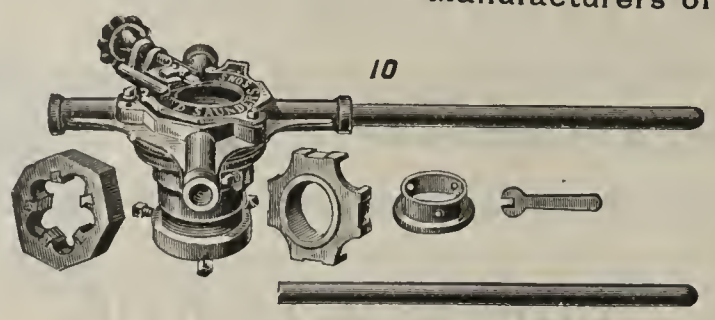
This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.



Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

First Principles of Electricity and Magnetism. By C. H. W. Biggs. 12mo, cloth, illustrations.....$1.40
For sale by David Williams Co., 232 William St. N.Y.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

CONTENTS.

Chapter I.—Simple Bell Circuit.
Chapter II.—Multiple Bell Circuit.
Chapter III.—Various Circuits.
Chapter IV.—Fire Alarms.
Chapter V.—Annunciators and Alarms.
Chapter VI.—Burglar Alarms.
Chapter VII.—Automatic Fire Alarms.
Chapter VIII.—Electric Gas Lighting.

Instructions on Joint Wiping

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

THE NEW METAL WORKER PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given, 75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

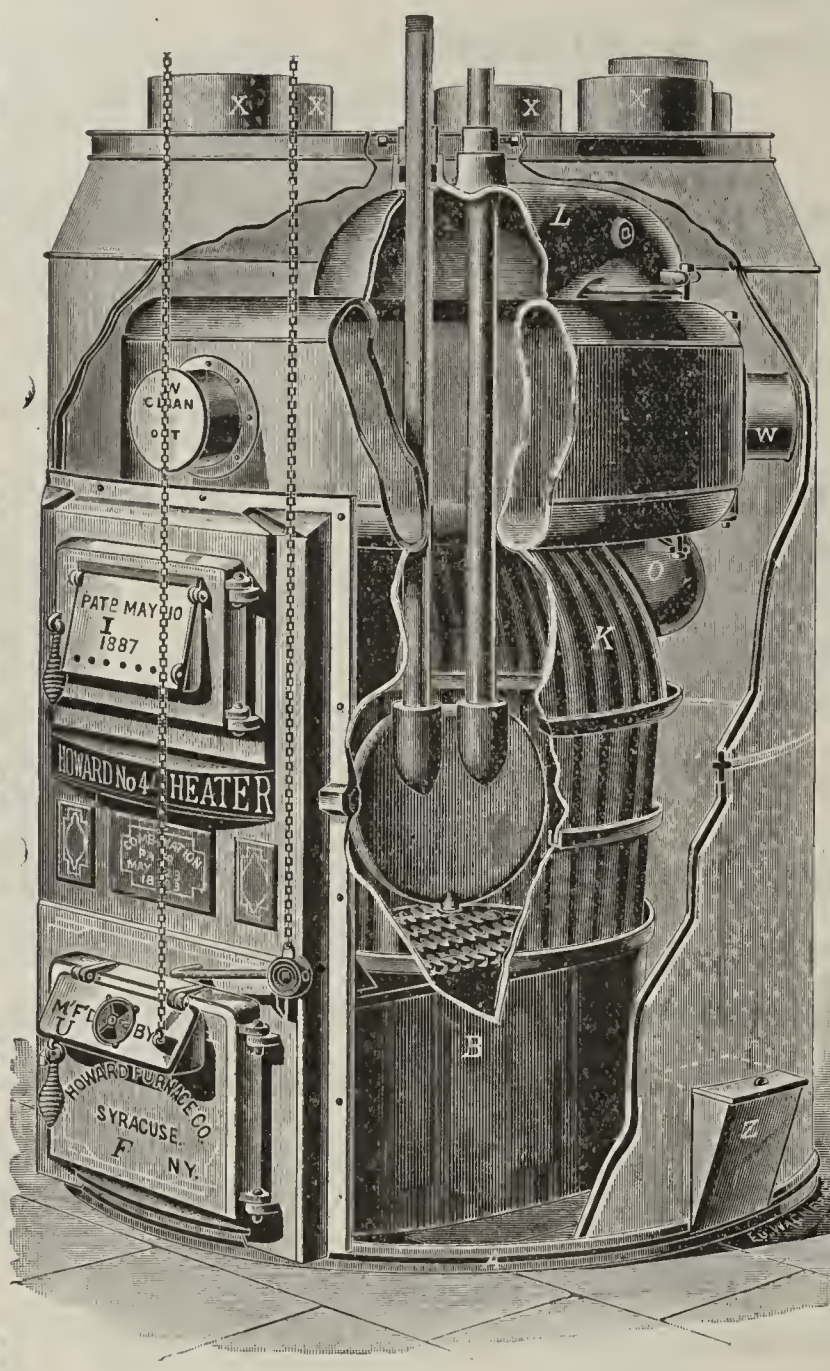
Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete



Encyclopedia of Pattern Problems

for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

limitation of effective heating.

When circumstances are such that pipes leading from a furnace are very long and level, the difficulty of conducting heated air through them renders the results meagre and unsatisfactory.

But with short pipes and a vertical delivery there is no system of heating so economical as the warm air furnace. There is a reason for the limitation of doing effective heating with heated air alone.

The power to move and deliver warm air from a furnace in any direction is simply ***gravity.*** The factors are the elevation or height and the temperature of air in the pipes. It can therefore be readily understood that a long run of piping lessens the elevation, and curtails an upward flow of air, while the impelling force cannot be produced without a sacrifice of fuel and a severe strain on the heater by maintaining a high temperature of furnace plate. It is apparent that by combining air and water into a system of heating, a current of hot water can be made to do effective work under a slow fire without overheating the furnace castings. In this way a mild heat is at all times established. An apparatus embodying all the desirable features of hot water and air heating is here offered to the prospective buyer.

The Business Situation.

Notwithstanding that political events during the past week or ten days have been of a somewhat sensational character, the business of the country was little, if at all, affected thereby and their influence, even on the sensitive surface of Wall street, was not seriously disturbing. The dispatch of a United States war vessel to Havana, the warlike occurrences in the far East, the introduction of the Cuban belligerency motion in the House, and the action of the Senate in taking up the Teller resolution for the payment of Government bonds in silver, were each seized upon by the "bear" element as a handle for assaults on stock exchange values, but without permanent success. The stock market at the close of the week showed pronounced strength, while the reports from trade centers indicate a large and growing measure of activity in business and industrial lines throughout the country. The demand for manufactured goods is unusually heavy for the season, surpassing all records in some instances and making a very large aggregate of current trade. Last week the payments through clearing houses were no less than 38 per cent. larger than for the same week of 1897, and 10.4 per cent. above the total clearings for the corresponding period of 1892. In correspondence with these favorable figures are the recent returns of railway earnings, which so far exceed those of the same period in January, 1896, by 17.5 per cent., and those of 1892 by 10.3 per cent. Moreover, the increases are general, extending practically to the entire list of roads. Business failures have been smaller than in any previous year at this time, falling short of last year, both in manufacturing and trading failures, by over 50 per cent. A temporary check to the distribution of goods is noted in the West through the heavy storms and severe weather which have prevailed this week in that section, but the volume of general business, even there, is still exceptionally large. Both manufacturers and merchants take a hopeful view of the situation and the multiplying evidence of reviving enterprise in all quarters is especially gratifying. Increased activity in building is a significant sign of returning confidence, as is an extraordinary expansion of business in the real estate market. Prices show no radical change, except that wheat again advanced to the dollar mark in Chicago. As a whole, prices in all lines remain steady with a rising tendency. Collections are generally reported as satisfactory.

The Manufacturers' Association and the Export Trade.

The report made by President Search to the National Association of Manufacturers this week at their annual convention in New York contains abundant ground for congratulation as well as much food for thought on the part of those interested in the development of the export trade of this country. The statistics of last year's foreign trade show a gain over 1896 of very nearly $200,000,000 in the total exports from the United States, which, for the first time in the commercial history of the country, exceeded a billion dollars. Of this amount, $276,000,000, or nearly 27 per cent., represented exports of manufactures, showing a gain in this department of almost $50,000,000 over the total foreign sales of American manufactured articles in the preceding year. The comparative percentage of manufacturing exports to total exports was also the largest recorded, with one exception. The figures presented by Mr. Search, which go back to 1821, show an almost startling growth in our outward foreign trade. Compared with 50 years ago the total exports have increased tenfold, while the exports of manufactured articles are no less than 17 times greater now than they were then. This tremendous expansion is a gratifying proof of the success our manufacturers have achieved in their invasion of the foreign markets. Mr. Search believes, moreover, that what has been achieved is but a slight suggestion of what will be accomplished in the future in this field when certain limitations, mostly artificial, are removed. First and foremost among these is the shipping question. The fact that the large bulk of American goods is shipped abroad in foreign bottoms is a distinct drawback. At the present time British ships take out $7 worth of our exports to every $1 worth carried in American vessels. The building up of the American merchant marine is a matter that is closely bound up with the development of the export trade. The establishment of a Federal Department of Commerce and Industry, with a Cabinet officer at its head, for the promotion and fostering of the business and industrial interests of the country is also strongly urged. This plan is followed in almost every other civilized country on the globe. The development of better international banking facilities; the promotion of technical education, which more than any other one thing has been the cause of the rapid growth of Germany as a manufacturing and exporting country; and the reform of the consular service, separating it from politics, are dwelt upon as all important questions, on the regulation of which depends in large measure the continued efficiency and expansion of our manufacturing and exporting interests. The extraordinary growth which has marked the foreign trade of this country in the past three years has been coeval with the organization and rise of the National Association of Manufacturers, who have done so much to encourage the export

trade and to stimulate American manufacturers to engage in it aggressively. The association have also initiated what promises to be a most valuable and important movement in the establishment of a sample warehouse for American goods at Caracas, Venezuela. They propose following this step up as rapidly as possible by opening similar establishments at Buenos Ayres, Kobe and Hamburg and ultimately in a number of other foreign commercial centers.

Anthracite Coal Statistics.

The January letter of the Anthracite Coal Operators' Association gives the following tables of the estimates of probable consumption and the shipments for each month of 1897, and their comparison with 1896; also of shipments by regions in 1897 and the five previous years. The October production of anthracite was the greatest for any month in the history of the trade. No estimates of consumption were made for October and November, and mining was pushed to its utmost:

	1897		1896	
	Estimated consumption. Tons.	Shipments. Tons.	Estimated consumption. Tons.	Shipments. Tons.
January	2,500,000	2,854,400	3,844,222	3,844,200

The promoters of the Pan-American Exposition to be held on Cayuga Island, Niagara Falls, in 1899, have decided to have a genuine novelty in the way of a railway to take the place of such attractions as the Ferris wheel of the World's Fair and of the Eiffel tower of the first Paris Exposition. This railway will be spiral in form and be operated up a tower 400 feet high. The basis of the railway will be a huge circular tower of steel frame work, around which, like the thread of a screw, the spiral railway will run. It will be supported on huge brackets firmly fastened to the frame work of the tower. This tower will have a diameter of 80 feet at the bottom and will taper 30 feet to the 400-foot level, giving a diameter at that hight of 50 feet. In making the ascent the cars will rise 40 feet in making the circle of the tower, or pass ten times around it in making the 400 foot level. The principle on which it will be operated will be very similar to the Mt. Washington and Pike's Peak roads, by means of a rachet rail. The grade of the line will be between 17 and 25 per cent. Every known safety device will be called into service, so that passengers will be better protected than they are while riding in steam or electric lines of to-day. It is proposed to face the seats of the cars outward, or away from the tower, and as the car ascends the view will broaden out until the entire section of country from Lake Erie to Old Ontario will be in full view, also many miles of country on the Canadian side. It will have two tracks, which will be on parallel but independent spirals. Above the landing for passengers there will be a great lantern, a huge globe of heavy glass with a map of the world outlined on it. This lantern will add 100 feet to the hight of the tower. At night the entire structure from top to bottom will be a mass of electric light, and from the top a powerful search light will cast its rays for miles around, lighting up the falls and rapids in regal splendor. Above this still the great glass globe will glow with light from within, all forming one of the most beautiful effects ever seen at a great exposition.

The annual meeting of the Franklin Institute was held in Philadelphia on January 19, when the following officers were elected for the ensuing year: John Birkinbine, president, re-elected; George V. Cresson, vice-president; William H. Wahl, secretary, and Samuel Sartain, treasurer. The annual report of the institute notes the addition of 100 new members during the year.

Antimony.

An official report on the production of antimony in the United States in 1896, by Edward W. Parker, just issued by the United States Geological Survey, contains some interesting information regarding the metal. It shows that the antimony of domestic production supplies a very small proportion of the consumption. The value of the domestic product has exceeded $50,000 in three years only—namely, in 1892, 1895 and 1896—while the imports have fallen below $200,000 only twice in the past 12 years, and have exceeded $400,000 in 1890 and 1892. The product of metallic antimony in 1896 was 601 short tons, valued at $84,290, the largest on record. In the eight years from 1880 to 1887 the production ranged from 35 to 75 tons, while from 1888 to 1894 it averaged a little less than 200 tons annually. During 1895 it jumped to 450 tons, 2¼ times the product of the year before, and in 1896 it was 33⅓ per cent. more than in 1895. In the two last years, however, the product was principally from imported ores.

The only commercial product of antimony obtained in the United States has been in the form of stibnite, or sulphite of antimony. Workable deposits are not found east of the Mississippi, and the Western deposits have only been worked on a comparatively smale scale. The States west of the Mississippi in which ores of antimony have been mined are Arkansas, California, Idaho, Montana, Nevada and Utah. Only two mines, one in California and one in Montana, produced any ore in 1896, and the amount was so small (33 tons in all, worth $1380) as to be hardly worth mentioning. The prices for metallic antimony for the past two or three years have been so low as not only to discourage any attempts to develop new mines, but to cause the closing down of those that were producing.

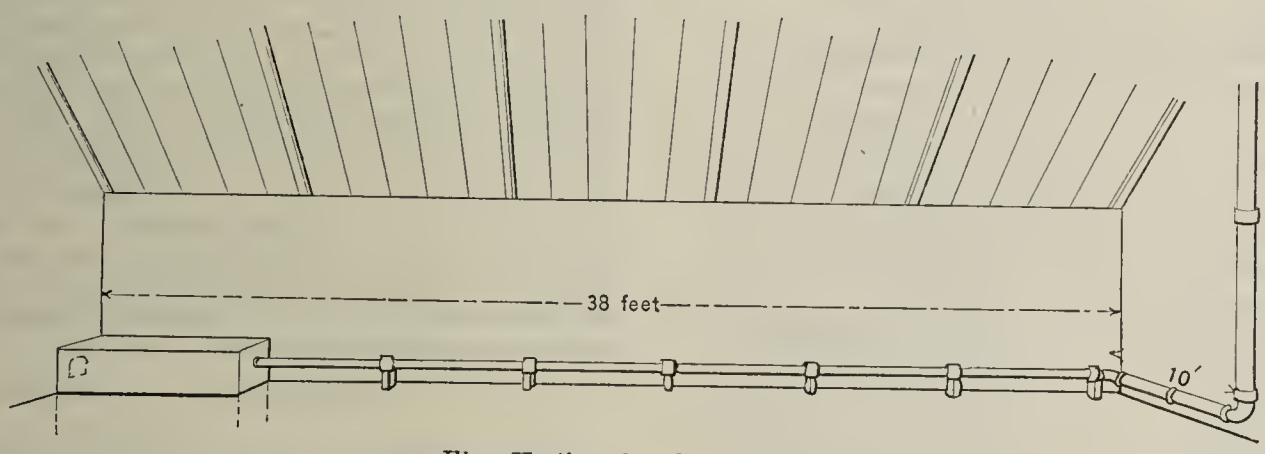
Smelters report that the low prices of antimony metal have stimulated consumption, and think the outlook is good for the use of antimony in many new processes and manufactures. One of the causes leading to the low prices of antimony in this country is a peculiar one. For many years the smelters depended largely upon domestic ores, but the supply was limited and uncertain, so that the smelters could not work systematically or economically. In 1894 the principal smelting company in the United States moved from San Francisco to Staten Island, and began the use of foreign ores almost exclusively. With a regular supply of ore and regular work smelting was carried on with greater economy, the output has been largely increased and prices to the consumer have been cut in half, having been reduced from 15½ to 16 cents for Cookson's brand in 1892 to 7⅛ to 8⅛ cents in 1896. The product of metallic antimony in 1896 was 601 short tons, the largest on record. In the eight years from 1880 to 1887 the production ranged from 35 to 75 tons. From 1888 to 1894 it averaged a little less than 200 tons annually. During 1895 it increased to 450 tons, 2¼ times the product the year before, and in 1896 it was 33⅓ per cent. more than in 1895.

A review of the prices of antimony ruling during the past seven years shows a history of steady decline. At the beginning of 1890 the price for Cookson's brand was 22½ cents per pound. During 1895 the price ranged from 7¾ to 8½ cents, and in 1896 a shade lower than this. It will thus be seen that in five years there was a decline of over 66⅔ per cent. in price. Since 1892 the decline has been about 50 per cent. In January of that year Cookson's was quoted at 15½ to 16 cents per pound. By December the price had fallen to 11¼ cents. During 1893 prices continued to decline slowly until 10 cents was reached, and in 1894, under continued depression, 8½ cents was quoted before the close of the year. The lowest price reached in 1895 was 7¾ cents, and in 1896, 7⅛ cents.

Antimony is chiefly valuable as an alloy with other metals. It is used to large extent with lead in the manufacture of type metal, to which it gives hardness, and, what is more valuable, it possesses the peculiarity, when used as an alloy, of expanding at the moment of solidifying, thus giving to the type a clean, sharp impression. From 10 to 16 parts of antimony in 100 are used in making britannia metal. Pewter contains about 7 per cent. It is also used in the manufacture of babbitt metal, and it has lately been used as an alloy with aluminum, to which it gives hardness and elasticity. Its effects on some metals is very injurious, particularly on copper, an almost inappreciable amount (one part in a thousand) destroying its good qualities.

On Monday, January 24, the golden jubilee in celebration of the discovery of gold in California in 1848 began at San Francisco. The festivities connected with the celebration are to continue throughout the week, and will culminate in the opening of the Golden Jubilee Mining Fair of California on Saturday. President McKinley will touch the button at Washington which sets the machinery of the fair in motion.

THE LETTER BOX.



Rating a Boiler.

From T. J. W., New York.—Will *The Metal Worker* inform me how many square feet of heating surface a tubular boiler will carry—a boiler having a capacity of about 30 horse-power?

Answer.—A common opinion in the trade is that 1 horse-power is equal to about 100 square feet of radiation, increasing or decreasing as the conditions may favor or hinder its efficiency. If the boiler in question is a 30 horse-power boiler working under good conditions it will probably carry 3000 square feet of radiation.

Flue Heating for Greenhouses.

From E. C., Saint Joe Station, Ind.—I would like to know if a greenhouse can be heated with a furnace made of brick and with a flue which runs the full length of the greenhouse and across one end, the flue to be made of tile and covered with 12 to 18 inches of brick and stone in order that the fire during the day will make heat enough for the evening. If so, what size tile would be proper to use? The greenhouse is about 38 feet long and 10 feet wide, and the furnace is to be located in one corner and the chimney to be located in the corner that is diagonally opposite. The furnace is to be 5 feet in length, 2½ feet wide and 4½ feet high. The smoke will be taken out of the furnace into the tile and carried along the side of the building across one end to the chimney, as shown in the sketch herewith. Should that tile be 7, 8, 9, 10 or 12 inches in size?

Flue Heating for Greenhouses

Answer.—The danger of a leakage of gas from the joints in the flue, whether it be made of brick or tile, into the greenhouse and ruining the plants, has caused hot water and steam to be looked upon with more favor by those who have had the most experience in the greenhouse business. However, to answer the inquiry of our correspondent, would say that a furnace of the size that he proposes to use is ample for the work, and that the flue which he proposes to use in connection with the furnace will be sufficient to heat the building, but it is quite probable that the fire will have to be continued during the night to accomplish the desired results. Owing to the fact that soot or fine ashes carried through the flue has a tendency to fill it up, it has been found that a flue made of brick 8 inches wide and 12 inches high is better adapted for the work than a tile flue, and when care is taken in building the flue there is much less danger of gas escaping than when tile is used, owing to the fact that it is difficult to keep the joints between the different tiles gas tight. Whether a tile or a brick flue is to be used, it should be supported above the ground so as to prevent the damp cold ground from absorbing the heat of the flue, and also to afford an opportunity for the circulation of the air. A comparatively small hot water heater properly piped would heat the building more satisfactorily, and when the risk of ruining plants is taken into consideration will be cheaper in the long run, even though the first cost is somewhat in excess of what a brick heater with a flue system would cost. If a tile flue is used, not more than 8 inches should be provided or the filling up will require it to be cleaned frequently.

Noisy Faucet.

From B., Port Hope, Ontario.—Will you be kind enough to tell me through the columns of *The Metal Worker* what is the cause and the remedy for a noisy hot water faucet? The firm I work for put in a job of plumbing in a house three months ago, and when the job was completed there was not a sound of anything. Since then the hot water faucet in the bathroom when opened make a rumbling and cracking noise in the pipes throughout the whole house, although for nearly three months this noise did not make itself heard. The water pressure at the point where the house is situated is about 60 pounds to the square inch, and the supply to the house is a ¾-inch pipe with the service cock shut half off in the cellar. The faucets used are the Fuller's improved combination hot and cold.

Note.—Almost invariably the noise heard under the conditions presented by this correspondent is due to some loose part in some one of the plumbing fixtures of the building, not necessarily the one in use. This may be a washer on a bib or the spindle of it, and the only way to locate it is to search until the troublesome part is found and tighten or replace it. The only specific direction which can be given is to examine every fixture till the loose one is found. In *The Metal Worker* of November 27, 1897, under the title of "How to Remedy Water Hammer" this trouble is described, and it is shown how far distant from the effect the cause of the noise may be found.

The annual report of the Board of Managers of the Lake Carriers' Association shows the largest enrolled tonnage in 1897 in the history of the association—namely, 687,237 net registered tons. The report shows that the smaller vessels in the lake service are dropping out and larger ones taking their places. The association are at present working upon a bill which is to be submitted to Congress, embodying a plan for the building up of the American merchant marine.

The National Monetary Convention opened at Indianapolis, Ind., on Tuesday, with 350 delegates.

FOURTH ANNUAL MEETING OF THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS.

TUESDAY MORNING.

The fourth annual meeting of the American Society of Heating and Ventilating Engineers was opened at 11 o'clock on the morning of January 25, at 12 West Thirty-first street, New York City, by the president, W. M. Mackay. The meeting was marked by the deep interest taken in the society by its members and those invited as guests. Among those present were the following:

Immediately after the roll call, President W. M. Mackay read his annual address.

PRESIDENT'S ADDRESS.

It gives me pleasure to welcome you to this, our fourth annual meeting, which I trust will prove interesting and beneficial to all. While there has been no marked improvement in the condition of business or trade during the past year, our society has not suffered from the general depression, but has grown steadily in point of numbers, those admitted to membership during the year amounting to fully 25 per cent. of our former membership, and coming from all sections of this country and Europe, showing that the interest manifested in advancing this, our chosen profession, is not local, but universal. No special effort has been made to increase the membership of the society, the majority of the applicants soliciting the honor rather than being solicited, which would indicate a recognition of the standing of the society and the necessity for a united action to elevate and advance our profession.

THE SPREAD OF KNOWLEDGE.

Our society has already been the means of accomplishing much good in diffusing a knowledge of the requirements and the best methods employed in securing good heating and ventilation, which we claim to be a necessity, and while some have felt that the imparting of information and data gained by years of application and study, and sometimes by a large expenditure of money used in costly experiments, would be injurious to the occupation of the heating and ventilating engineer, it has been found that a more general public knowledge of the requirements and apparatus best suited for accomplishing the purpose has increased the demand for competent heating and ventilating engineers and the use of scientifically designed materials and systems of heating and ventilation, and still what has already been accomplished sinks into insignificance when compared with the possibilities of a society like ours with a membership embracing the leading men in the profession in all sections of the country. A united effort on the part of the individual members of the society will in time awaken the different State and municipal governments to the fact that good heating and ventilation are necessities and not luxuries, and will secure for our profession the same recognition and legislation as is accorded to other professions of no greater importance.

To accomplish the greatest amount of good for ourselves and others, it is desirable that we should avail ourselves of every opportunity to advance the interests of the society, that in electing officers and appointing committees we should select those who can best fill the different positions and who are willing to devote a reasonable amount of time to the affairs of the society. We should also endeavor to increase our membership by securing as members or juniors all who are eligible for such membership. This can be best accomplished by the individual members in the different sections of the country where they are located. The officers of the society can be assisted in conducting the affairs of the society by a free discussion on the part of the members of Topic No. 4, presented at this meeting.

AMENDMENTS AND SUGGESTIONS.

The members will be called upon to vote on several additions and amendments to our constitution as recommended by the committee appointed to consider this matter at the last annual meeting and handed in in writing by the members.

The first change suggested is to strike out the age limit for members and juniors. The second amendment relates to the meetings of the Board of Managers and the Council, and defines more clearly the duties of the Council. The third amendment provides that our constitution may be amended at any regular meeting of the society by notifying the members of such amendment in writing at least 60 days in advance of the annual meeting The fourth amendment is to correct an error in regard to those entitled to vote; and the fifth amendment provides that the president and secretary shall be members of the Council as well as members of the Board of Managers, and that by this change the Council be increased to seven instead of five members.. As all of these changes, as suggested, are the result of careful consideration, and seem to be for the best interests of the society, I would ask for them your attention, consideration and judgment. We have adopted a society badge or button. It is worn by a number of our members, and I would suggest that all of our members who wish to be known as belonging to our society procure and wear this emblem. A number of our members use the name of the society on their stationery and cards. It is desirable that all members should avail themselves of this privilege.

The question of a summer meeting, as provided for in our by-laws, was left in the hands of the Board of Managers with power at our last annual meeting, and they arranged a meeting at the Windsor Hotel, in this city, on the evening of June 18, 1897. That meeting was so successful, so largely attended and brought our society into such prominence that I would strongly urge that you follow the same course this year.

COMMITTEE REPORTS.

Our Committee on Uniform Contract and Specifications will submit their final report at this meeting. Our Committee on Compulsory Legislation have been active during the year, assisted by individual committees and

members in the different States, and they will, no doubt, be able to report substantial progress since the last annual meeting. Our Committee on Standards will possibly have some additions to offer to their last year's report, and I trust that by another year we will be able to devote a certain amount of the funds of the society to be used by the Committee on Tests in making such tests as they may decide on, and the reports of which will be of value to the society.

The proceedings for 1897 were delayed in order to include a report of the summer meeting. They have now been completed and have been sent forward to the members entitled to them. I learn that some of the members did not receive the 1896 "Proceedings." Those who did not can obtain them by corresponding with the secretary.

The impression has been created that because a number of papers presented at the meetings of the society related to the construction of fans and blowers and the installation of these systems we as a society were only in favor of mechanical means for procuring ventilation. I wish to correct this impression and to say that as a society we do not indorse any system or method to the exclusion of any other. We ask that certain results be obtained, whether it be by steam, hot water, hot air, electricity, natural or mechanical means, and we number in our ranks the exponents of all these systems and some who use different systems to meet different conditions or requirements.

It has been stated that because the question of heating related more to personal comfort than to health, we should not ask that the heating of buildings be regulated or enforced by legislation. I believe that heating is more of a necessity than a luxury in this country, and that it is wrong to compel children and others to occupy buildings that are improperly or imperfectly heated; and while I am a strong believer in and advocate of good ventilation, I believe that heating and ventilation should go hand in hand, and that when a public building is insufficiently heated it should be condemned until remedied, in the same way that we would ask the State governments to act in regard to buildings having insufficient and imperfect or defective ventilation. I say this, believing that a large amount of sickness and death, particularly among children, is due to buildings which they occupy not being properly or uniformly heated.

REPORTS.

The report of the secretary, which was next presented, showed the affairs of the society to be in a prosperous condition and contained the gratifying announcement that the membership during the past year had increased 20 per cent.

The treasurer's report showed an increase in receipts and a decrease of expenses, with a larger balance in the treasury.

The report of the Board of Managers showed that frequent meetings had been held, and spoke of the successful summer meeting which accounted for the delay in issuing the book of "Proceedings" for 1897.

The Council reported that greater care should be taken in filling out applications for membership, and also stated that the future of the society was bright and increased interest was being taken in it. A summer meeting was strongly advised.

The following list of new members for the year was then announced:

NEW MEMBERS.

Juan A. Almiral, New York.
Reginald P. Bolton, New York.
W. H. McKiever, New York.
Frank K. Chew, New York.
C. Wadsworth, New York.
Robert Campbell, New York.
J. A. Gorton, New York.
George O'Hanlon, New York.
Henry C. Meyer, Jr., New York.
R. E. Atkinson, Leicester, England.
Samuel M. Green, Holyoke, Mass.
Sanford C. Smith, Buffalo, N. Y.
Nelson S. Thompson, Washington, D. C.
E. T. Weymouth, Brooklyn, N. Y.
Geo. E. Adams, Glens Falls, N. Y.
J. S. Farrell, Indianapolis, Ind.
Charles G. Folsom, South Bend, Ind.
J. W. Gifford, Attleboro, Mass.
Samuel Graham Neiler, Chicago, Ill.
F. H. O'Neill, Philadelphia, Pa.
Oliver Schlemmer, Cincinnati, Ohio.
E. P. Sparrow, Malden, Mass.
W. H. Switzer, Little Falls, N. Y.
Wm. S. Washburn, Brockton, Mass.

JUNIOR MEMBER.

H. H. Ritter, New York.

ASSOCIATE MEMBER.

Henry A. Smith, New York.

The Committee on Compulsory Legislation stated that bills had been presented in the Pennsylvania and New York Legislatures, and that legislation regarding better ventilation could be secured if active interest was taken in the subject by the members, and representatives waited upon the proper committees of the various legislatures.

The Committee on Standards reported that they had sent cards to the school authorities in 150 towns, asking questions as to the systems in use, the amount of air supplied per pupil per hour, the space allotted per pupil, the floor area allotted per pupil, and the number of pupils to a room. Thirty-four answers were received, which the committee tabulated, showing that all methods were used, from stoves to the modern fan system; that from 1200 to 2000 cubic feet of air per hour was provided in the better buildings; that from 175 to 250 cubic feet of space was allotted per pupil, and from 10 to 25 square feet of floor space, with an average of 15 square feet, per pupil, and that an average of 40 pupils occupied each room.

The president appointed as tellers J. G. Sorgen, N. P. Andrus and A. H. Fowler.

AMENDMENTS.

Amendments to the constitution were taken up, and Sections 2 and 3 of Article 2 were amended by eliminating reference to age.

Article 5 was amended so that the president and secretary are members of the Council.

Article 10 was altered so that the constitution may be amended at any regular meeting, the proposed amendments to be presented to the members at least 60 days prior to the meeting.

Article 6 was amended by the elimination of the word associate.

The meeting then adjourned.

TUESDAY AFTERNOON.

On the opening of the afternoon session the president introduced to the members Hugo Ehrenburg of Hamburg, Germany, who was followed by George I. Rockwood of Worcester, Mass., who read a paper on a new type of hot blast radiator, and which is printed in part elsewhere.

After this had been thoroughly discussed a paper was read by John Gormly, Philadephia, on "Some Experiments in Steam Circulation," which is printed in another column.

Discussion of this paper tended to the conclusion that the trouble was largely due to faulty boiler construction and to improper piping in connection with boilers restricted in steam space and not arranged for a free internal circulation.

On motion a committee consisting of W. F. Wolfe, B. H. Carpenter and H. J. Barron was appointed to visit schools in New York City representative of past and present practice of heating and ventilation and report to the society.

Topical discussion was then taken up.

TUESDAY EVENING.

On opening the evening session the president announced that Thomas E. McNeill extended an invitation to the members to visit the New York Trade School.

The report of the tellers showed the election of the following officers, which was formally announced by the president:

President, Wiltsie F. Wolfe.
First Vice-President, J. H. Kinealy.
Second Vice-President, A. E. Kenrick.
Third Vice-President, John A. Fish.

Secretary, S. A. Jellett.
Treasurer, J. A. Goodrich.

Board of Managers.

W. M. Mackay. Francis A. Williams.
Thomas Barwick. John A. Connolly.
A. C. Mott.

Council.

R. C. Carpenter. W. S. Hadaway.
A. A. Cryer. Henry Adams.
Wm. McMannis.

A paper was then read by Prof. R. C. Carpenter on "A Test of the Heating and Ventilating Plant. New York State Veterinary College, Cornell University, Ithaca, N. Y."

This paper and the discussion occupied the evening until adjournment.

WEDNESDAY MORNING.

The morning session, which was opened at 10.45, began with a paper read by J. J. Blackmore on "Proportioning of Circulating Pipes for Steam and Hot Water Heating Systems." This paper will be found on another page of this issue.

Professor Carpenter stated that new tables had been made by both himself and Mr. Wolff better adapted for general use, and that the data quoted were based on certain conditions, and he submitted a formula for the preparation of the table, giving the amount of radiation that can be carried by a given pipe of given length. We print below the two tables referred to. The first is by Professor Carpenter:

SIZE OF STEAM MAINS.

Commercial Sizes of Steam Mains for a Single Pipe System of Heating by Direct Radiation; Pressure, 0.5 Pound; Friction Resistance, 6 Inches of Water for Lengths of 100 feet, 12 Inches of Water for Greater Distances.

Radiating surface, square feet.	Length of steam main, feet. 20	40	80	100	200	300	400	600	1000
20	1	1	1¼	1¼	1¼	1¼	1¼	1½	1½
40	1¼	1	1¼	1¼	1¼	1¼	1¼	1½	1½
60	1¼	1	1¼	1¼	1¼	1¼	1¼	1½	1½
80	1¼	1	1¼	1¼	1¼	1¼	1¼	1½	2
100	1¼	1½	1½	1½	1½	1½	1½	1½	2
200	1½	2	2	2	2	2	2	2½	3
300	2	2	2	2	2	2½	2½	3	3½
400	2	2	2½	2½	2½	3	3	3	4
500	2	2½	2½	3	3	3	3½	3½	4
600	2½	2½	3	3	3½	3½	3½	3½	4½
800	2½	3	3½	3½	3½	3½	4	4	5
1,000	3	3½	3½	4	4	4	4	4½	6
1,400	3½	3½	4	4	4	4½	4½	5	6
1,800	4	4	4	4	4½	5	5	6	7
2,000	4	4	4	4½	4½	5	5	6	7
3,000	4½	4½	4½	5	5	6	6	7	9
4,000	5	5	5	6	6	7	7	7	9
6,000	5½	5½	6	7	7	7	7	8	10
8,000	5½	5½	6	7	7	8	8	9	11
10,000	6	6	6	7	8	8	9	10	12
12,600	6	7	7	7	8	8	10	11	12
14,000	7	7	7	8	9	9	10	12	14
16,000	7	8	8	9	9	10	11	(?)	14
18,000	8	8	8	9	10	11	11	(?)	14
20,000	9	9	9	10	11	11	12	14	16

In using the above table take the equivalent lengths as explained on page 226 of Carpenter's "Heating and Ventilating Buildings."

A. R. Wolff's Table for the Capacity of Steam Pipes, with Separate Returns, 100 Feet in Length.

Diameter of supply in inches.	Diameter of return in inches.	2 pounds pressure. Total heat transmitted in B. T. U.	2 pounds pressure. Rad. surface, sq. ft.	5 pounds pressure. Total heat transmitted in B. T. U.	5 pounds pressure. Rad. surface, sq. ft.
1	1	9,000	36	15,000	60
1¼	1	18,000	72	30,000	120
1½	1¼	30,000	120	50,000	200
2	1½	70,000	280	120,000	480
2½	2	132,000	528	220,000	880
3	2½	225,000	900	375,000	1,500
3½	2½	330,000	1,320	550,000	2,200
4	3	480,000	1,920	800,000	3,200
4½	3	690,000	2,760	1,150,000	4,600
5	3½	930,000	3,720	1,550,000	6,200
6	3½	1,500,000	6,000	2,500,000	10,000
7	4	2,250,000	9,000	3,750,000	15,000
8	4	3,200,000	12,800	5,400.000	21,600
9	4½	4,450,000	17,800	7,500,000	30,000
10	5	5,800,000	23,200	9,750,000	39,000
12	6	9,250,000	37,000	15,500,000	62,000
14	7	13,500,000	54,000	23,000,000	92,000
16	8	19,000,000	76,000	32,500,000	120,000

In the above table each square foot of radiating surface is assumed to transmit 250 heat units per hour as safe and conservative as treated, as will be seen by consulting Chapter IV of Carpenter's work on heating. For pipes of greater length than 100 feet multiply results in the above table by the square root of 100, divided by length. In all cases the length is to be taken as the equivalent length in straight pipes of pipe, elbows and valves, as given on page 226.

For other lengths multiply above results by following factors:

Length of pipe	200	300	400	500	600	700	800	900	1,000
Factor	0.71	0.58	0.5	0.45	0.41	0.38	0.35	0.33	0.32

For example, the capacity of a pipe 8 inches in diameter and 800 feet long would be 0.35 of 12,800 square feet of radiating surface = 4480 square feet. It will be noted that the size of the return specified by Mr. Wolff is about one pipe size greater than is believed to be necessary by the author (Professor Carpenter), but sizes of main steam pipes are in substantial agreement with tables on page 226.

H. C. Meyer, Jr., then read a paper by Prof. J. H. Kinealy on "The Effect of the Hights of Walls on the Amounts of Heat Transmitted Through Them." This paper is printed elsewhere.

George I. Rockwood read a paper by Mark Dean on "Single Pipe Low Pressure Steam Heating," which is printed elsewhere.

WEDNESDAY AFTERNOON.

The afternoon session opened at 2 o'clock with the resumption of the discussion on the paper on "Single Pipe Low Pressure Steam Heating System."

Topical discussion was opened on the topic, "Does Our Society as at Present Conducted Meet the Objects of Its Organization as Laid Down in Article I of the Constitution?"

Mr. Rockwood urged that the objects of the society could be expressed more briefly, and favored explaining more fully the duties of the Council and secretary.

The general impression, as shown by the discussion, was that the society had become established very quickly, that its value was becoming more generally known, and that it was already following a course that had advanced its interests in the best way.

Discussion was asked on the following topic: "What Size Reducing Valve Is Required to Deliver the Steam and Fill a 10-inch Pipe at 1 Pound Pressure, the Steam Being Reduced from 8 Pounds to 1 Pound Pressure?"

H. J. Barron: I believe that it is better to use a valve on the large pipe and to put a reducing valve on a by-pass around the valve.

S. A. Jellett: We have never used larger than a 4-inch reducing valve in our work.

A. G. Paul: In some plants we have found the use of a large valve necessary.

The committee which visited schools reported that a school representing past practice had been examined briefly, and a steam plant that had been in use probably 20 years was found. The radiation was of the direct character, and in one room there was an open fire place, and with this and the windows down at the top a fair atmosphere was found. In a classroom of the same building the air had to be diluted by opening the windows to make the atmosphere tolerable. In the halls semidirect radiators were placed, but as the vent registers were near the ceiling there was little benefit.

A modern plant visited provided a good atmosphere throughout. There were both blower and exhaust fans, and a high pressure boiler to supply the engines for running the fans, and two low pressure boilers for the heating coils and semidirect and direct radiation. The fresh air was taken through a duct extending 35 feet high. The heated air was discharged at an opening in the window sill to prevent falling cold air from the glass surface. Sixty-five pupils were found in rooms that should have been occupied by but 45, but as 225 cubic feet of space per pupil was provided the atmosphere was good. This plant, though hurriedly looked over, reflected credit on the contractor in the workmanship, and on the City of New York for its high grade of heating plants.

B. F. Stangland read the experience of an early advocate of school ventilation from a pamphlet by Hayden W. Wheeler, who started to work for better school ventilation in Brooklyn in 1881. He found many schools where but 60 cubic feet of space and as little as 2 square feet of floor space was provided. He suggested that each mem

ber examine the schools in his vicinity and report at the next meeting.

THURSDAY MORNING.

On opening the morning session a letter was read from D. Ewart, chief architect Public Works Board at Ottawa, Canada, asking for an expression of the views of the members as to the relative value of box coils and cast iron radiators as heaters when the coils are covered with a marble slab at the top and screens at the side.

Joseph Wright of Toronto, Canada, then explained that the construction of box coils aided in the accumulation of dust, interfering with radiation, while vertical cast iron radiators prevent the dust from depositing.

Under discussion it was deemed that in meeting the conditions of practice the coil radiator was sometimes impaired in efficiency, but could not be considered as 20 years behind the times, as mentioned in the letter. The arrangement of marble tops and screens should be such as to allow a free circulation of air and permit the surface to be readily cleaned. Other remarks were as follows:

W. M. Mackay: In removing an old system that had been in use for 15 years I found an accumulation under the radiator and above it under the slab that more nearly resembled hair felt than anything generally known. This naturally impaired the circulation, and consequently the efficiency. In practice the efficiency of a coil has been demonstrated as 15 per cent. superior to cast radiators.

H. J. Barron: The efficiency of the coil is conceded, but as to the progress in the trade, the handsome cast iron radiator, conforming to the architectural and other requirements, certainly represents a very decided advance.

A. H. Fowler: Tests have recently been made with a cast iron radiator that showed an efficiency superior to iron pipe coil.

Joseph Wright: I am fitting up a building now on an entirely different plan of heating, changing the air every 15 minutes, although the outside air is frequently from 15 to 25 degrees below zero, but the system was not designed by an architect, as the heating system was where the incased coil radiator under discussion was specified.

H. C. Meyer: I would like to ask about the relative durability of cast and wrought iron pipe for the purpose.

Joseph Wright: I have never had trouble with cast iron pipe, but have had wrought iron pipe give out in ten years, and have taken out other coils that were in good order after 20 years of service.

On motion the president was empowered to appoint members from different States to act in conjunction with the regular Committee on Compulsory Legislation.

On motion the president was authorized to appoint a committee of five in each large city where there are members, to report at the next annual meeting on the methods of heating five school buildings.

THURSDAY AFTERNOON.

On opening the afternoon session C. Wadsworth read a paper by D. M. Nesbitt on "English Practice in the Warming and Ventilation of Technical and Art Schools," which was discussed in part as follows:

S. A. Jellett: The method of ventilating chemical laboratories as described has been of special interest to me, as it is a very difficult task.

Professor Carpenter: I am very much pleased with the paper and the presentation of a typical system. I should prefer, however, a forced blast system under the same conditions. The conditions of use in our college buildings is very different from the conditions presented in the paper. Our rooms are used for a much shorter period of time, probably averaging less than two hours.

S. A. Jellett: To get an even temperature in some rooms, to let the warm air in and ventilate on the same side of the room, is not sufficient without the use of direct radiation on the cold side.

H. J. Barron: The system discussed is too expensive, and for that reason is not up to the needs of the times. The English engineer prefers the brick ducts, because it is taken from his bill of cost.

On motion of W. F. Wolfe a vote of thanks was given to the author of the paper.

A paper by B. H. Carpenter was then read on "Heating and Ventilating Church and Parish Buildings by Forced Draft," and was discussed as follows:

George I. Rockwood: This is a cleverly designed plant for the conditions to be met. I think that as a rule the heating in a church is liable to be overdone, while the ventilation is, as a rule, very much underdone.

R. M. Geddes: I have visited the church in question, and its construction was of such a nature as to require two fans to get the best results, the exhaust fan giving a more positive control of the ventilation than could be had without it.

Following this discussion, S. A. Jellett, reporting for the Uniform Contract Committee, said that it had met with a committee from the National Association of Master Steam and Hot Water Fitters and that they had agreed that three contracts be prepared, one from the steam fitters' standpoint, one from the engineers', and another from the consumers' point of view, these contracts to be presented at another meeting and a final agreement reached on a contract to be submitted to the National Institute of Architects.

Ex-President Mackay then introduced the president, W. F. Wolfe, to the society, who asked the support of the members in building it up to the high standard that was required in the field in which it was working, as the importance of its work was becoming more urgent.

Topical discussion was then taken up, after which the president announced the following committees for the year:

COMMITTEES 1898-99.

Compulsory Legislation.

B. H. Carpenter, Wilkes-Barre, Pa.
N. P. Andrus, New York.
George H. Mehring.
T. B. Cryer.
Andrew Harvey.

Uniform Contracts and Specifications.

D. M. Quay, Chicago, Ill.
A. E. Kenrick, Brookline, Mass.
H. D. Crane, Cincinnati, Ohio.
J. J. Blackmore, New York.
A. C. Mott, Philadelphia.

Standards.

J. H. Kinealy.
H. J. Barron.
Wm. McMannis.

Tests.

A. A. Cary, New York.
B. F. Stangland, New York.
Henry Adams, Washington, D. C.

Nominations.

Wm. M. Mackay, New York.
R. C. Clarkson, Philadelphia.
John A. Fish, Boston, Mass.
Chas. M. Wilkes, Chicago, Ill.
Andrew Harvey, Detroit, Mich.

On carrying the motion to adjourn *sine die* another annual meeting of the society closed, having again given demonstration of its usefulness in the free exchange of valuable expert knowledge, and having awakened increased interest in its work. The meeting was attended by a large number of members and a larger number of guests, among whom were two from foreign countries.

At a meeting held on January 26 in New York City of the National Founders' Association, called to perfect a defense association, the following officers were elected: President, W. H. Pfahler of Abram Cox Stove Company, Philadelphia; vice-president, C. L. Newcomb of Deane Steam Pump Company; treasurer, W. H. Wells; secretary, John A. Penton of Detroit, Mich.

The Richard Thomas Brass Foundry Company have been organized, at Anderson, Ind., by Richard Thomas, T. J. Morgan and Alexander Jones.

HEATING AND PLUMBING.

A New Type of Hot Blast Radiator.*

BY GEORGE I. ROCKWOOD, WORCESTER, MASS.

The type of radiator which I am about to describe, and which is fully illustrated in the drawings accompanying this paper, is the outcome of my efforts to design a wind surface condenser on correct principles. My idea was to have this pipe condenser serve as a tempering coil in a large factory building and at the same time give the engine the benefit of as nearly perfect a vacuum as would be possible with such a condenser for the sake of economy of steam and to enable the engine to do as much work in the summer time as it did in the winter. I expected to use water instead of air to condense the steam in the summer. Before this tempering coil had been designed or built a large hot blast heater had been contracted for, set up, and put at work heating the building. This heater was like hundreds of others which the company had built before and which had given satisfaction to their owners. Therefore I had no thought of questioning the correctness of the principle upon which it had been designed. It was in two divisions, each consisting of nine sections, with 80 1-inch pipes in a section, each 8 feet long. In the contract it was agreed that exhaust steam was to be the heating agent, and that, working in conjunction with the tempering coil, it should successfully heat the building under certain extreme conditions of cold weather. In one sense the terms of the contract have been fulfilled, as the building is nicely heated under those conditions with exhaust steam.

Previous to the time when the heater was at work it was my intention to make the tempering coil just like it. On reflection, however, and after observing carefully how the heater behaved, it became evident that, to be a success as a condenser, the tempering coil would have to be dripped differently. The air pump would short circuit the steam through some one of the sections by causing it to pass up two or three risers and over to the drip system, leaving the other sections full of air and vapor. It was also plain that the steam must be so admitted to the condenser as to drive the air ahead of it in a positive manner. Making the steam connections to the different sections in series instead of in multiple would satisfy this condition, as the steam would then have to go through each and every section before it could appear at the vapor pipe leading to the air pump.

The most difficult problem, however, was to remove the water of condensation from each section without at the same time providing a path through which the steam could go with it to interfere with the steady action of the pump as soon as it should get there. The water could not be trapped satisfactorily from a vacuum. Neither would it be best to connect it from base to base, as this might bring about both a short circuit and a water hammer. A separate pump might be used into which all the drips might connect through siphons. This thought pointed to the solution of the difficulty; for by siphoning the several drips to the final section and making the drip pipe of this section quite large, to exhaust quickly the air driven ahead by the entering steam, a nearly perfect forced circulation is combined with a practical method of getting rid of the water of condensation. This plan was followed in the construction of the tempering coil, which contained about 1400 square feet of heating surface. It has been in place now about two winters, and has abundantly demonstrated its superiority to the much larger heater of standard make located by its side.

FIG. 2

Description of Radiator.—In the engravings Fig. 1 is a front elevation of the radiator and air pump. Fig. 2 is a side elevation of the radiator and fan. A portion of the sheet iron housing of the radiator is removed in this view to show the risers. Fig. 3 is a sectional plan view of the cast iron bases at *a b*. The arrows show the course of the steam in passing from one section to another. The slanting partition divides the set of risers in a section from the returns in that section. Thus it is clear that the only path the steam can take, to get from one section to the next, is to ascend the risers and return through the return pipes; then it passes around the ends of two adjacent sec-

tions. The drips are clearly shown in this view, also in Fig. 4, which is a plan of heater, air pump and fan. The sheet iron housing belonging on the top of the risers is, in this view, omitted to show them better.

One of the advantages of constructing a radiator in the way here shown is that one large valve takes the place of many smaller ones as a regulator of the amount of heat admitted to the entire radiator. This valve may be regulated automatically to maintain the temperature of the room at a constant point, thereby permitting the speed of the fan to remain constant and thus give at all times the required degree of ventilation. This is a point which deserves emphasis. There are school rooms in which the air is foul, notwithstanding the fact that there is sufficient fan capacity in the ventilating system, the cause being simply that the temperature of the room is varied by varying the speed of the fan instead of the amount of heat admitted to the heater. Another advantage is that no matter how much or how little steam is admitted to the radiator, the heating effect extends entirely across the radiator. One section cannot be heated at all until the section behind it is entirely heated.

So far as I know, this type of heater suffers from but one disadvantage, which is not theoretical, but is commercial in its nature. In order to provide enough pipe capacity, if I may so describe it, or cross sectional area, in the bases, they must be over twice the depth ordinarily allowed these castings. That is to say, the entire body of steam must pass through the first base; what is not condensed in that section must pass through the second, and so on. This means that cast iron for these bases will cost twice as much as in an ordinary radiator. On the other hand, however, greater depth of casting in the present type would do it no harm, for the tendency is to make these bases too small to provide room for the steam, water and air to pass each other comfortably. The difficulty has been partially surmounted by slanting the partition dividing each section in the manner shown in Fig. 3. If theoretical considerations alone controlled the shape of each section base, then a different depth might be used for every one, the maximum depth being given to the base at which the steam first enters. The cost of pattern making, however, which such a gradation of depths would entail, taken in connection with the advantage to a thorough diffusion which greater depth than is absolutely necessary would give, prohibits such a design. It will be obvious from an inspection of the drawings that each base is exactly like every other in all respects except that half are rights and the other half are lefts. One pattern and one core box are enough to mold either a right or a left, by simply drilling the 1-inch pipe holes on one side of the casting for one kind and on the other side for the other kind.

The specific points of superiority of this heater over the ordinary, or multiple supply, heater are four in number:

1. The impossibility of air binding.
2. The simplicity of the means for regulating the supply of steam.
3. The uniformity with which the pipes in any section are heated.
4. The perfection of the method of dripping the sections, which occurs without noise or waste of steam.

In conclusion I will restate that the new type of radiator shown is chiefly advantageous to use with steam of low or atmospheric pressure and that this is chiefly due to the fact that the different sections are connected together in series instead of in multiple. In other words, the radiator is designed to really produce a forced circulation of steam, instead of a circulation which may or may not take place, according as circumstances favor or disfavor the free passage of the air out of drip pipes.

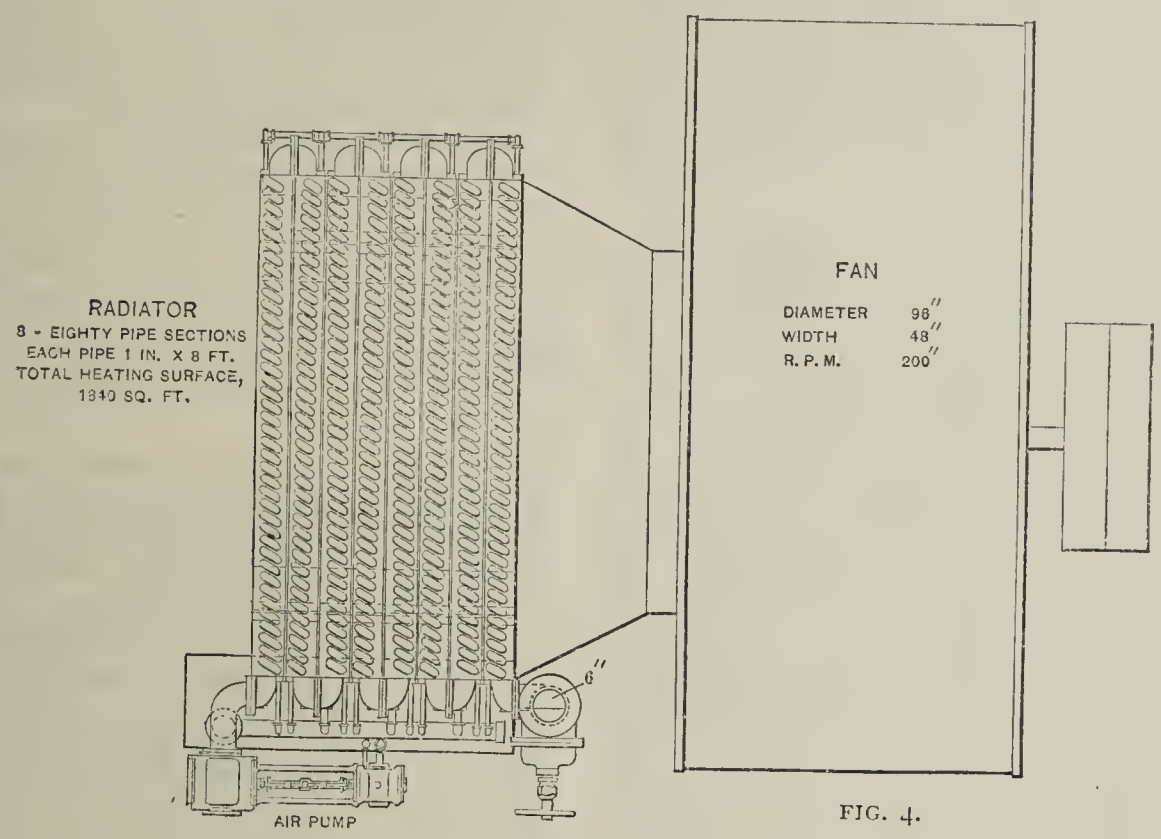

FIG. 4.

District of Columbia Plumbing Regulations.

The District Commissioners have transmitted to Congress the draft of a bill regulating plumbing and gas fitting in the District of Columbia. The bill, as drafted by the Commissioners, authorizes them to appoint a plumbing board, to be composed of two master plumbers, one journeyman plumber competent to be licensed as master plumber, and two employees of the District having a knowledge of plumbing, gas fitting and sanitary work, at a salary of $300 per annum, payable monthly. The board, in addition to duties assigned it by the Commissioners, shall examine all applicants for license as master plumbers or gas fitters. The age of applicants must not be under 21 years, and a license fee of $3 is fixed. It shall be unlawful for any person to engage in the work of plumbing or gas fitting in the District unless he is licensed or is an employee of a licensed master plumber, and it is also made unlawful for owners or lessees to knowingly employ unlicensed plumbers, and, further, to cut or trench in any highway, reservation or public space without a permit from the Commissioners. For violations of the provisions of the act a penalty of not less than $5 or more than $100 is fixed, with the usual provision for default.

Grand Rapids Master Plumbers.

At a meeting of the Master Plumbers' Association of Grand Rapids, Mich., held January 20, the following officers for the year 1898 were elected:

President, G. A. Richards.
Vice-President, George Thompson.
Secretary, W. C. Weatherby.
Treasurer, William Robertson.
Sergeant-at Arms, B. Powers.
Delegates to the State Convention: George Thompson, William Robertson, C. A. Scheufler.

The Standard Steam Specialty Company, 83 Centre street, New York City, issue a pamphlet on Governors. The title page informs the reader that he cannot name the Governors of five States that are chosen. It goes on to say that he does not even know the name of the best Governor, but will discover it if he will follow out the leading of the pamphlet. The next two pages give the names of the Governors of the different States, the parties they represent and the dates of the commencement and expiration of their terms. The real interest of the pamphlet, however, as an advertising medium lies in the pages that follow, and which call attention to the Standard Utility Pump Governor and Midget Pump Governor made by the Standard Steam Specialty Company.

The Effect of the Hights of Walls on the Amounts of Heat Transmitted Through Them.*

BY J. H. KINEALY, ST. LOUIS, MO.

It is known, as a result of experiment, that the heat which passes per hour through a wall separating a hot fluid from a cool one can be expressed by the equation

$$Q = k\ (t_1 - t_2)\ S$$

in which Q is the quantity of heat, in heat units, transferred per hour from the hot to the cool fluid; k is a factor whose value depends upon a consideration that will be discussed later; t_1 is the temperature of the hot fluid; t_2 is the temperature of the cool fluid and S is the area in square feet of the surfaces of the wall in contact with the hot and cool fluids.

The experiments of Peclet and others have shown that the value of k depends upon the nature of the hot and cold fluids; upon the separating wall, the nature of its surface, the materials of which it is made, its thickness and its figure; and somewhat upon the difference $t_1 - t_2$. The value of k depends upon two things—the loss of heat by radiation, and the loss by direct contact. The loss by radiation depends upon the temperature, t_2, of the surrounding bodies, and the loss by direct contact depends upon the temperature of the air in direct contact with the separating wall, which may be higher or lower than the temperature of the surrounding bodies. The greater the difference between the temperature of the warm fluid and that of the cool air in direct contact with the separating wall the greater will be the loss by direct contact and the greater will be k for a given value of t_2 ; and the less this difference the less will be the loss by direct contact and the less will be k.

Peclet made a great many experiments from which to determine the value of k. Most of his experiments were made with steam or hot water as the hot fluid and air as the cool fluid. When steam was used the temperature t was uniform throughout the hot fluid, as it depended simply upon the pressure of the steam; and when water was used it was kept agitated, so that it would have as nearly as possible a uniform temperature throughout. The temperature, t_2, of the cool air surrounding the radiator containing the steam or hot water was measured at some distance from the radiator and not directly at the surface of the radiator. As a result of his experiments Peclet found that, for the same value of t_1 and t_2, k was less for a high wall than for a low one of exactly the same material and thickness. The explanation for this is that as the air in contact with the separating wall is heated it rises along the surface of the wall, and as it rises it continues to be heated until finally, when it reaches the top of the wall, it is much hotter than it was when it was at the bottom of the wall. The higher the wall the higher will be the temperature of the air when it reaches the top, and, therefore, the higher will be the average temperature of the air in contact with the surface of the wall. The higher the average temperature of this air the less will be the average difference between its temperature and that of the steam; and therefore the less will be the amount of heat lost by direct contact of the air and the less will be the value of k.

The conclusions arrived at by Peclet through his experiments are corroborated by experience. It is well known that the air leaves a high radiator at a higher temperature than it does a lower one, when both are supplied with steam at the same pressure, and that a high radiator loses less heat per hour per square foot of surface than a lower one.

I find that many French, English and American writers, reasoning, apparently, from the results of Peclet's experiments and from experience with radiators, say that the value of k for a high wall or window of a building will be less than for a lower one of the same kind and thickness. Some writers make the deliberate statement that a high wall or window will transmit less heat from a room, with given inside and outside temperatures, than a lower one of the same kind, area and thickness. This, I contend, cannot be true, as it is based upon an assumption of conditions that are never realized in practice.

The air on the outside of a wall or window of a heated room is of almost a uniform temperature. It is hardly probable that, on a cold day, when the wind is blowing, there is any appreciable current of warm air rising along the outside of the wall or window of a heated building. I have never been able to detect such a current on a cold day; and yet such a current of warm air is supposed to exist by many writers.

The temperature of the air inside of a heated room is not uniform at different hights from the floor, but is least near the floor and gradually increases toward the ceiling, where it is greatest. So far I have been unable to establish any law for this increase. It depends upon the outside and inside temperatures and upon the method of heating. It is greater in cold weather than in mild weather, and is greater for a hot air system than for direct steam or hot water radiation. It may depend also upon the part of the room at which the temperatures are measured That the air near the ceiling of a heated room is much hotter than that near the floor is well known to all who have had occasion to stand on a step ladder in a warm room. Hence the conditions that actually prevail in a heated room are:

A uniform temperature of the air on the outside of the wall and a gradually increasing temperature from the floor to the ceiling of the air on the inside. And for a temperature of about 70 degrees 4 or 5 feet from the floor the average temperature of the air inside of the room increases as the hight of the wall is increased. Therefore, the higher the wall or window surfaces of a room the greater will be the amount of heat lost per hour through them, and the greater must be the value of k used in the formula for calculating the heat lost.

German engineers, as a rule, increase the calculated heat loss for rooms whose exposed walls are higher than 12 or 13 feet by an amount which depends upon the hight of the walls.

J. H. Klinger, in his pocket book for heating engineers, advises that the calculated heat loss of a room be increased by 3 per cent. of itself when the walls are between 13 and 14½ feet high; by 6.5 per cent. when they are between 14½ and 18 feet high, and by 10 per cent. when they are higher than 18 feet.

H. Recknagel, in his pocket book for heating engineers, advises that the calculated heat loss of a room be increased by 10 per cent. of itself when the walls of the room are more than 13 feet high.

H. Rietschel, in his treatise on heating and ventilating, calculates the temperature of the air at the ceilings of rooms, when their hights exceed 13 feet, by the formula

$$t_1 = t + 0.03\ (h - 13)\ t.$$

t_1 is the temperature of the air at the ceiling; t is the temperature of the air about 5 feet from the floor, or head high, as Rietschel says, and h is the hight of the room from the floor to the ceiling.

He takes the average temperature of the air in the room as

$$\frac{t_1 + t}{2} = t + 0.015\ (h - 13)\ t.$$

If the hight of the room is less than 13 feet he takes the temperature at head high from the floor as the average temperature. The temperature t_1 must never be taken as greater than 1.5 t.

Rietschel uses the average temperature of the air in the room when calculating his heat loss. The writer has found that the increase of temperature of the air in a heated room varies from ½ to 2 degrees for each foot of hight above the floor, and that for rooms whose hights are about 12 feet the average temperature of the air may be taken as equal to the temperature measured 4.5 or 5 feet from the floor. When a room is heated by hot air it is probably safe to say that when the temperature of the air in the room is 70 degrees 5 feet above the floor the temperature at a distance h from the floor is about $65 + h$. If h is taken as the hight of the ceiling above the floor, the average temperature between the floor and the ceiling is about $65 + \frac{h}{2}$.

For work in connection with ordinary dwellings or schools it makes very little difference whether a high wall or window transmits more or less heat per hour than a lower one of the same kind and thickness, as the walls of the rooms are usually not much higher than 12 feet, and the average temperature of the air is about the same as the temperature observed about 4.5 or 5 feet above the floor. But for work in connection with churches and other buildings in which the hights of the rooms are quite great it becomes important to know whether the heat loss of a high wall is or is not different from that of a lower wall of the same kind, area and thickness; and if the heat loss is not the same for the high as for the lower wall, it is of the utmost importance to know whether it is smaller or greater.

Writers on heating seem to have divided themselves into two classes: those who consider that the high wall transmits less heat and those who consider that the high wall transmits more heat. I am inclined to think that the second class is the smaller, yet I am sure that their view of the matter is the correct one; the high wall transmits more heat than the lower one.

My attention was first called to the different opinions of engineers on this matter by the editor of one of our weeklies running his blue pencil through an article I had written, in which I stated that the heat loss of a high wall is greater than that of a lower one of the same kind, area and thickness. As you all know, an editor, armed with a blue pencil may be an exceedingly inconvenient opponent, but I had the temerity to try to convince him that I was right, and finally succeeded in having the blue pencil mark erased.

If now I have succeeded in convincing the members of the society that my position in the matter is the correct one, this paper will have accomplished its object.

*Read at the New York meeting of the American Society of Heating and Ventilating Engineers, January 25-27, 1898.

Proposed Ventilation Law for New York.

A standing committee of the American Society of Heating and Ventilating Engineers devotes its labors to securing the enactment of laws to provide for the proper ventilation of buildings. We give below a bill which has been prepared by this committee which has been introduced into the Legislature of New York State by Senator Wray of Brooklyn, and which the committee are now endeavoring to have made law. They solicit the aid of all who are interested in good ventilation by having them explain the objects to Senators and Assemblymen in their locality. The bill is now before the Judiciary Committee and in order for the third reading:

AN ACT

To provide for proper sanitation, ventilation and protection from fire of schoolhouses and other public buildings.

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. Every schoolhouse and other public building hereafter erected in a city or incorporated village within this State shall be provided with proper means for ventilation in such manner that there shall be at all times a sufficient supply of pure air therein; shall be provided with a reasonably sufficient number of proper water closets, earth closets or privies for the use of persons occupying or admitted to such schoolhouse or building; and shall be kept clean and free from all noxious smells and gases arising from any drain, privy or other nuisance.

SEC. 2. No wooden flue or air duct for ventilation or heating purposes shall be placed in any schoolhouse or other public building; and no pipe for conveying hot air or steam in any such building shall be placed nearer to any wood work therein than one inch, unless such pipe shall be properly protected by suitable guards or casing of incombustible material.

SEC. 3. Before the erection, construction, alteration or repair of any schoolhouse or other public building is commenced, the person or persons or corporation owning the same shall submit a detailed statement in writing of the specifications and a full and complete copy of the plans of such proposed building, erection, construction, alteration or repair, which shall be accompanied by his, their or its sworn statement in writing setting out in full the provisions contained in such plans and specifications for the sanitation, ventilation and protection from fire of such schoolhouse or other public building as provided by this act. Such detailed statement, specifications and copy plans shall be submitted to and filed with the Health Board or other officer or officers having like jurisdiction within an incorporated city where such schoolhouse or other public building is about to be erected, and in all other places, including any city having no officer or officers exercising jurisdiction as a board of health or health officer, such detailed statement, specifications and copy plans shall be submitted to and filed with the State Board of Health. No such schoolhouse or other public building shall be erected, constructed, altered or repaired until such specifications and plans shall be approved in writing by the Board of Health or officer exercising jurisdiction thereof, to whom such plans shall be submitted as required by this act. The sanitation, ventilation and protection from fire of every such schoolhouse and other public building as provided by this act shall be subject to the inspection of such Board of Health or other officer exercising like jurisdiction during the progress of such erection, construction, alteration or repair by its or his agents or servants, and shall conform in all things to the reasonable requirements of such Board of Health or other officer exercising like jurisdiction.

SEC. 4. The word "schoolhouse," as used in this act, shall be taken and deemed to mean any building in which public or private instruction shall be given to not less than ten pupils at one time; and the words "public building," as used in this act, shall be taken and deemed to mean any building or premises used as a place of public entertainment, instruction, resort or assemblage, or for the purpose of transacting public business of any kind or nature whatsoever where there shall be more than ten persons in any such building at any one time. Provided, however, that this act shall apply only to cities and incorporated villages.

SEC. 5. Any violation of this act or failure to comply with its provisions by any school committee, public officer, corporation or other person whatsoever, shall be a misdemeanor.

SEC. 6. This act shall take effect immediately.

The plumbing firm of Albee & Babbitt, Bellows Falls, Vt., consisting of George B. Albee and Frederick H. Babbitt, have dissolved partnership. Mr. Albee bought out his partner's interest and will continue the business.

Some Experiments in Steam Circulation.*

BY JOHN GORMLY, PHILADELPHIA, PA.

Having occasion recently to locate a steam boiler of the pattern usually designated a saddle boiler, with a fire 12 x 16 inches, and a maximum rated capacity of 150 square feet of radiation, tapped 2½ inches on the top for a steam pipe, I attached to it 120 square feet of steam radiation. The mains, not being covered, would run the radiation up to 150 square feet. Of this amount 25 feet were on the third floor, 45 feet on the second floor and 50 feet on the first floor. The boiler was located in the basement in such manner that in no case was there more than 12 feet of a horizontal run. The pipes were graded with a fall of 1 inch in 10 feet. I connected all the radiators on the single pipe system, the condensation being returned through the feed pipe of each radiator. I placed on each radiator an automatic air valve with a hard rubber pencil, the expansion of which closed the valve when heated. All radiators containing above 25 square feet of surface had 1¼-inch connection; all below that size had 1-inch pipe. So far I followed customary practice, but I could not refrain from experimenting on so small a plant, because the cost would be little and a demonstration would be as effective as one on a more expensive apparatus. I therefore graded the pipes so that the rise was from the boiler to the radiators, placing no drip or relief pipes on the job. The water of condensation necessarily ran in a contrary direction to that in which the steam traveled. There was no other connection between the bottom and the top of the boiler than a 1¼-inch pipe, to the side of which the water column and gauge glass were attached. The boiler was connected to an excellent flue. On firing up the water remained in the water glass until ½ pound was registered on the gauge. At that pressure the water disappeared down the water glass with a steady motion and so swiftly that in 10 seconds it was out of sight. I then opened the fire door. The water returned as swiftly as it had gone. I repeated this experiment several times, the disappearance and return of the water occurring each time. Had I been experimenting to discover a pump to throw water to the upper floors with ½-pound pressure this apparatus would have been a success. I then tried to determine the effect of placing ¾-inch drip pipes at the foot of all the vertical risers, of which there were three. These drip pipes were carried separately to the base of the boiler and there attached to it. On again firing I was somewhat surprised to discover that I had made no change in the working of the apparatus, unless it was to accelerate the disappearance of the water. I then assumed that the automatic air valves could be blamed for part of the effect, the loose hard rubber stems of the valves slipping over the passage from the valves into the radiators and acting as a check to the admission of air when a partial vacuum was in the radiators. I then replaced the automatic valves with others having no rubber pencil, but operating with a metallic bar which, by expansion and contraction, opened and closed the valves. These were positive in action, and could not be closed unless the radiator was filled with steam. On firing up again I had the same result as at first, which was a surprise.

I now looked to the boiler for the cause of this peculiar action. I noticed that when the water line of the glass was out of sight there was always a steady stream of water, very small, but yet very perceptible, running spirally down the glass on the inside. I decided to tap the two main steam branches close to the boiler and directly above it, in such a manner that any water running along the bottom of the mains would be intercepted. It was also intended that this pipe should act as an equalizing pipe. It was made large and the base of it tapped into the bottom of the boiler. When again fired up it was found that a steady water line was maintained. The plant has now been running steadily for two months. It gives entire satisfaction.

I have concluded that in this instance the form of the boiler was the cause of the peculiar action of the water. The boiler had probably not more than 1 inch of water surrounding the fire box. There was no local circulation possible in the boiler as it came from the makers. I believe all boilers should have a good circulation of the water contained in them, and that a steam boiler should contain much more water within itself than a water boiler. I wish to call special attention to the fact that in this experiment all the radiators, even to the third floor were filled to the line of the automatic valves with water As the third-floor radiator was about 30 feet above the boiler, and as we had but ½ pound of steam on the plant, I should like to have the views of our members as to the cause of water being forced to that hight.

As the automatic valves were open and could not be closed while they were cold, it was not a vacuum that held the water in the radiators; but what did hold the water there? Personally, I incline to the view that the pipes and radiators were filled with globules or bubbles of

* Read at the New York meeting of the American Society of Heating and Ventilating Engineers, January 25-27, 1898.

water and steam alternating with each other in much the same manner that water is pumped by the Pohlé pump, except that in the Pohlé system air is used instead of steam. I believe these globules or bubbles would be materially assisted in their formation by the oil left in all pipes by the fitters. On mentioning the peculiar action of this job to a friend he assured me that with the same make of boiler a vertical line of single pipe to three floors had acted in much the same manner with him, but in his case the lower radiator was hot and the radiators on the second and third floors remained cold and were partially filled with water. He remedied the trouble by tapping the boiler both at the water line and at the base, then connecting the two taps with a 2-inch pipe. This settled the trouble. His water line was a disappearing one before he made the connection on the boiler which I have described.

The Chicago Plumbers' Ball.

The Chicago Master Plumbers' Association enjoyed their annual reception and ball on Tuesday evening, 25th inst. The festivities were held in Medinah Temple, one of the finest places in Chicago for an occasion of this kind. The day had been one of the worst in years, with a heavy snow fall and every indication of its continuing in the evening. But despite the difficulty experienced in traveling a very large attendance gratified the managers and the members. Had the weather been pleasant the hall would have been much too small. Paul Redieske was chairman of the Arrangement Committee, with the following colleagues: P. M. Murphy, C. C. Breyer, F. P. Schuster, C. J. Herbert, J. R. Alcock, E. Hackett, Robt. Griffith, J. J. Doyle, D. J. Rock, T. P. Culloton, Sam'l Smith, J. O. Sawkins and J. J. Clark.

Chairman Redieske opened the proceedings with an address of welcome, and presented a short but very acceptable entertainment, consisting of musical selections by Miss Edna Good, the gifted ten year old daughter of Samuel Good, a member of the association; songs by John Fruin, also a member of the association, and E. H. O'Brien, a friend of Mr. Fruin; amusing tricks by a professor of legerdemain, &c. In behalf of the association President J. J. Wade presented the retiring president, Thomas Conlin, with a gold emblem set with a diamond. Both gentlemen made happy speeches which were received with enthusiasm. Dr. Arthur R. Reynolds, commissioner of the city Health Department, being present was called upon for some remarks and responded with sentiments showing his hearty sympathy with the efforts of the plumbers to improve sanitation. The dancing programme occupied the remainder of the evening, and probably a portion of the following day.

Quite a number of visitors were present from other cities and from considerable distances. Among them were Samuel L. Malcolm of New York, vice-president of the National Association; John Hickman of Paterson, N. J., member of the National Executive Committee; W. E. Goodman of Milwaukee, treasurer of the National Association; Charles Polacheck of Milwaukee, Hubert Kelly of Minneapolis, James Johnson of Denver, M. J. Ward of St. Louis, Thomas Davis of Rock Island, R. J. Shand of Rockford, J. J. Hanighen of Omaha and Mr. Bellamy of Bellamy & Hornung, Omaha, who is universally believed among his friends and acquaintances to be the real author of "Looking Backward."

Single Pipe Low Pressure Steam Heating Systems.*

BY MARK DEAN, BOSTON, MASS.

Single pipe systems for low pressure steam heating may be divided into three general classes, each with variations—the uphill system, the drip system, and the circuit system. Believing the latter to be the best, it will be the one discussed in this paper. But, regardless of the system adopted or rules given, the heating engineer must employ active common sense in order to meet the requirements of each individual case. I do not mean to depreciate the value of rules and formulæ; on the contrary, I believe they are necessary, but on account of varying conditions it is impractical to make a rule that will cover all cases. The statements made and the formulæ given in this paper are based on ordinary conditions—the average building as we find it to-day supplied with commercial cast iron direct radiators and heated to 70 degrees F., with an outside temperature of zero.

As the size of the pipe depends upon the work it is to do, we must know the size and location of each radiator, because from the total condensing power we get the size of the main steam pipe, and the size of each branch is also computed from the amount of radiation it is to supply.

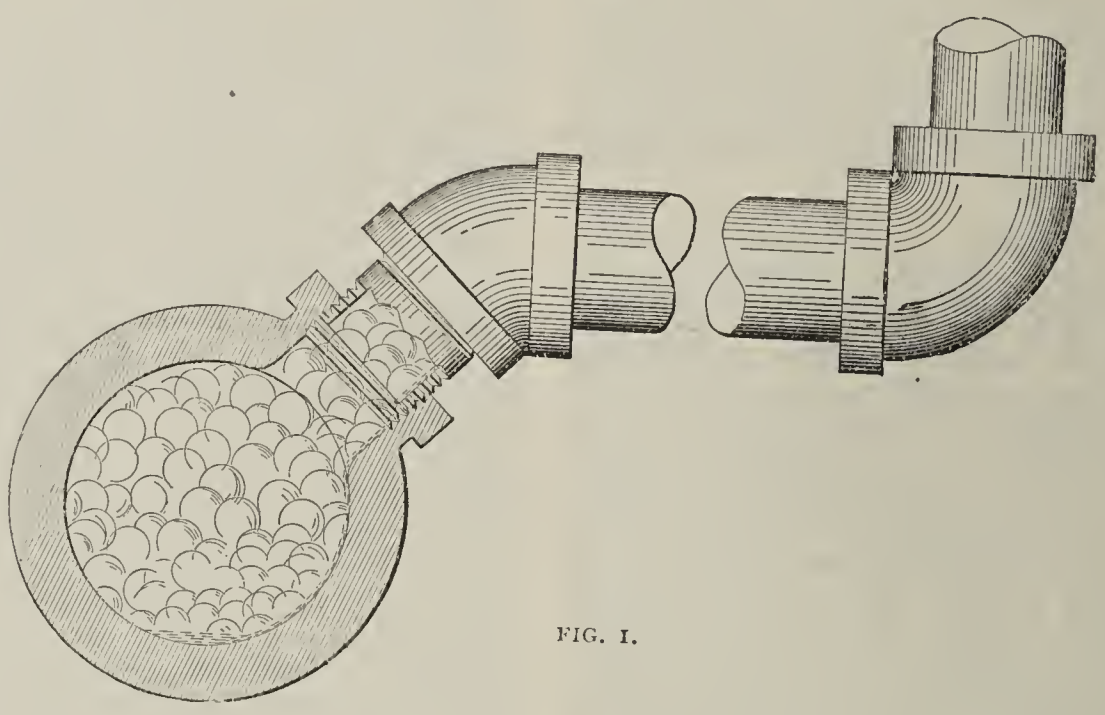

FIG. I.

The requirements of the steam main are threefold; it must be large enough to carry, at low pressure, sufficient steam to supply the total radiation, carry the condensation, and maintain at its extreme end a pressure equal to the initial pressure at the boiler. To find the size of pipe capable of fulfilling the above requirements divide the number of square feet of radiation to be supplied by 100, extract the square root of the quotient, and the answer will represent in inches the diameter of supply pipe. Thus:

$$\sqrt{\frac{R}{100}} = D,$$

in which R = the number of square feet of radiation to be supplied and D = the diameter in inches of the main supply pipe.

When the answer is a fraction of a pipe size the next larger size should be used, and pipe smaller than 2 inches diameter should not be used for mains.

BRANCHES.—Requirements of branches differ from those of mains, because the water of condensation returns to the main against the flow of steam. Therefore they not only supply sufficient steam for all radiation attached to them, but must do so without allowing the steam to attain sufficient velocity to impede the flow of the return water. To determine the maximum velocity at which steam may travel in branches having a rise of not less than 1 inch in 4 feet (if they are ever given less, one size larger pipe should be used), multiply the external circumference of the pipe by 1½, and the answer will be the number of lineal feet per second faster than which the steam should not travel. Whenever the branches have

* Read at the New York meeting of the American Society of Heating and Ventilating Engineers, January 25-27, 1898.

an incline in excess of 45 degrees the velocity may be increased to double the external circumference of the pipe, dropping all fractions from the answer, which will be the maximum number of lineal feet of steam travel per second.

To ascertain how much radiation any branch pipe will supply at velocities given above use the following formula :

$$\frac{V}{L} = C. \quad C \frac{0.0387}{0.00007} = R,$$

in which V = the velocity of the steam per second,
L = the length of pipe containing 1 cubic foot,
C = the number of cubic feet of steam delivered per second to radiator, and
R = the number of square feet of radiation supplied.

The following table, giving the size of pipes, velocity of steam and amount of radiation supplied, differs somewhat from general practice in the amount of radiation supplied by some pipes, but I believe it to be correct :

Table A.

Size of pipe.	External circumference of pipe.	For pipes having an incline of not less than 1 inch in 4 feet.		For pipes having an incline of not less than 45 degrees.

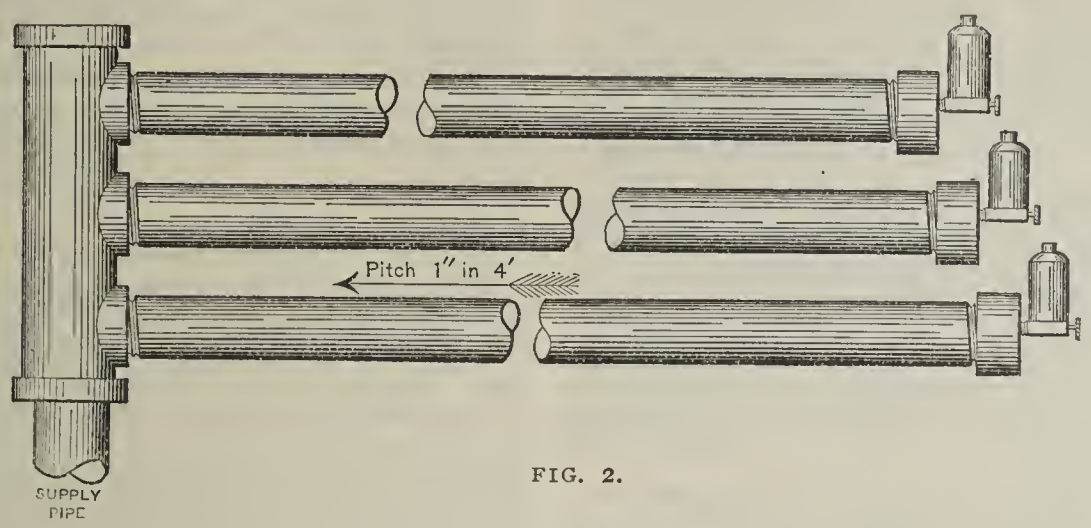
When the temperature to be maintained is less than 70 degrees deduct from the amount of radiation to be supplied by mains or branches as given herein 1½ per cent. for each degree drop in temperature.

After having ascertained the size of mains and branches they should be located on the plan, beginning at the boiler with the main supply pipe, which should rise immediately to its highest point, whence it should have a gradual descent of not less than ½ inch in 10 feet to its extreme end. If there is a tendency for the expansion to work the pipe toward the boiler the pipe above it should be braced to prevent any movement of it and thereby prevent straining the boiler. On large jobs, and sometimes on small ones, it is desirable to reduce the size of the main pipe. Whenever this is done an eccentric fitting should be used, so as to prevent a water pocket. When calculating the size of main pipe beyond a reducer allow sufficient area for water of condensation from branches already passed, plus sufficient area for steam for all branches yet to be supplied. It is not advisable on small jobs to reduce the size of main pipe, except in special cases. All mains should be carried at least 2 feet beyond the last branch, where they should empty into a return pipe through a drop connection, so as to leave no water in the pipe. From this connection the return pipe should be extended to the boiler above the water line and there dropped down to return opening in boiler. There should be a combination (for either steam or water) automatic air valve on end of return pipe above water line. Whenever conditions prevent placing the return pipe overhead it may be run below the water line. The return should always have a drain cock at its lowest point. For returns 1-inch pipe should be used on jobs having 500 or less square feet of radiation. Increase the pipe size ¼ inch for each additional 1000 square feet of radiation or fraction thereof. The mistake of making the main too small and the return too large is very common.

Branches may be taken off the main from the top, side or any angle between the top and side. The best connection is made by turning the tee about 45 degrees upward into a close nipple, 45-degree bend, and branch pipe, as shown in Fig. 1. It will be observed that this style of connection takes the steam from near the top of main and returns the water to the bottom. By using a pitch ell at the bottom of riser this connection will give the desired grade to branch pipes, allow the riser to stand plumb, and in conjunction with the 45-degree bend allow for expansion and contraction of the main.

Branch pipes may be reduced in size, as occasion demands, either by a reducing fitting or bushing, preferably the former. The vertical portion of branches, as will be seen by consulting Table A, can often be reduced without injury to the working of the plant. Expansion and contraction of the horizontal portion of the branches is generally too slight to require attention, but when an allowance for it is necessary, it can generally be made by an offset in the pipe. If the radiator is too close to a riser that will expand upward, connect to end of radiator furthest from the riser. Large radiators, the internal connections of which are of less capacity for the amount of radiation they contain than the pipe sizes recommended in Table A, should not be used. I hope the day is not far distant when all large radiators will be put together with large openings between the loops.



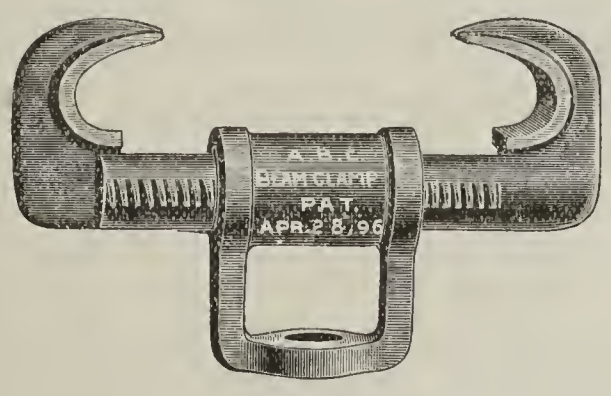


FIG. 2.

If coils are to be used instead of radiators connect them in the manner illustrated in Fig. 2—*i. e.*, single pipe system. It will be noticed that only one header is used. there being an air valve on the end of each pipe. The saving of fittings and labor more than compensates for the extra air valves, which should be of some pattern that can be used either as automatic or straight. The superiority of this arrangement for moderate weather is quite obvious. The writer's experience in low pressure heating leads him to the belief that, after having properly proportioned and graded the pipes, the less complications the better.

The A B C Beam Clamp.

The Illinois Malleable Iron Company, 30 and 32 West Monroe street, Chicago, have placed on the market the A B C beam clamp, made of malleable iron, illustrated herewith. It is very strong and simple. The hooks are held together by the sleeve part of the middle piece, and the hanger supporting the line of pipe is suspended by means of a rod and nuts. The sleeve when turned a quarter allows the clamp to be adjusted, and it is then locked by turning it back to its original position, the teeth of the hook engaging in corresponding slots on the inside of the sleeve. The hooks are sharpened where they extend over the flange of the beam, so that they can be driven under the brick. This clamp will fit beam flanges from 3 to 7 inches wide, and they are made in three sizes, to take rods made of pipe ¼, ⅜ and ½ inch in diameter. Any pipe hangers can thus be connected.

The A B C Beam Clamp.

Proportioning of Circulating Pipes for Steam and Hot Water Heating Systems.*

BY J. J. BLACKMORE, NEW YORK.

The art of supplying artificial heat for buildings by means of hot water and steam has made rapid progress during the past 30 years, and yet, notwithstanding this undoubted progress, there still remains a good deal of doubt as to the proper method of adjusting the size of flow and return pipes for heating plants of different sizes. Several rules have been formulated to meet this want by engineers, but they all differ materially as to the size needed.

George H. Babcock, in a paper read at the meeting of the American Society of Mechanical Engineers during the year 1885, submitted the rule that : "The diameter of the main steam supply pipe should be equal to one-tenth of the square root of the total amount of radiation in a system." W. J. Baldwin practically uses the same rule in his book on "Steam Heating," though he does not define it in exactly the same way. A. R. Wolff, in the addendum of a little book by W. R. Briggs, Van Nostrand's Science Series, No. 68, offers a rule, that : "The area of the main steam pipe should be equal to 0.375 square inch for each 100 square feet of heating surface, and when live steam is fed to the system a ratio of 0.19 square inch is sufficient." Prof. R. C. Carpenter of Cornell University, in his recent work on "Heating and Ventilating Buildings," gives different ratios, from 0.90 square inch down to 0.225 square inch, based upon the velocity of steam flowing through the pipes at different pressures.

Let us first consider the application of the rule of Mr. Babcock and Mr. Baldwin to four different size plants, one of 400 feet, one of 1000 feet, one of 1600 feet and one of 15,000 feet. For the 400 feet we have a 2 inch pipe, for the 1000 feet a fraction over a 3 inch pipe, for the 1600 feet a 4-inch pipe and for the 15,000 feet a pipe a little over 12 inches in diameter.

Now let us take that of Mr. Wolff of 0.375 square inch of area to each 100 feet of radiation. By this rule we would have a 1½-inch pipe for 400 feet, 2¼-inch for 1000 feet, 2¾-inch pipe for 1600 feet and for the 15,000 feet an 8½-inch pipe.

We will now consider the rule of Professor Carpenter of 0.90 square inch of area in the main for each 100 feet of surface ; this gives a little better than a 2-inch pipe for 400 feet, a 3½-inch pipe for 1000 feet, nearly a 4½-inch pipe for 1600 feet and a 13 inch pipe for the plant containing 15,000 feet.

Comparing the rule of the two gentlemen first named with the rule of Mr. Wolff we find a difference of nearly 100 per cent.; comparing the same two with Professor Carpenter we find a difference of over 12 per cent.; comparing Professor Carpenter with Mr. Wolff there is a difference of 130 per cent., certainly a very wide variation and very puzzling to the novice in the science of heating by steam and hot water.

Professor Carpenter, in the work before referred to, is the only writer who mentions the fact that a different ratio is required for a small plant than for a larger one, and he says it in these words (page 225): "A. R. Wolff gives the following rules for determining the cross sections of area of pipes." Then follows the quotation of Mr. Wolff's rule, upon which he comments: "By consulting the table it will be seen that the constant for area, 0.375, found in column two, corresponds to a velocity in the steam mains of about 62 feet per second, and it is not well suited for use with low pressure steam, or when resistance to flow must be very small." Professor Carpenter here admits that a ratio suitable for a large plant cannot safely be applied to a small one, but he leaves the impression on the mind that the difference is because a pressure of 5 pounds is carried on the large plant and only the pressure of the atmosphere is kept on the small one.

Mr. Wolff does not state that he carries a pressure when using the ratio of 0.375, but he says : "It will be ample to allow a constant of 0.375 square inch, plus, for each 100 feet of heating surface in coils and radiators, 0.375 when exhaust steam is used and 0.19 square inch when live steam is used." This clearly shows that Mr. Wolff set the ratio for atmospheric pressure, or nearly so, as he gives the same for exhaust steam, and further when he uses the ratio 0.19 he does so because with live steam a pressure is carried. This clearly shows that these engineers suggested and used these rules for atmospheric pressure. These gentlemen are all practical engineers and have done and are doing excellent work on the basis of these rules.

A close investigation of the basis for these rules proves them to be correct, provided we allow each one the premises upon which he based his calculations. They all err in allowing it to be supposed that the ratio is a fixed quantity for all sizes when the length and pressure are equal. Errors have been made by following these rules without a proper appreciation of the conditions for which they were provided.

* Read at the New York meeting of the American Society of Heating and Ventilating Engineers, January 25-27, 1898.

For some years the writer has believed that a simple rule could be adopted that would reconcile these differences and establish safe ratios for all sizes of plants. With this end in view various observations have been made on different plants from time to time, as the occasion presented itself to verify the correctness of the rules here presented, and they seem to accord well with the experience of many successful engineers.

Pipes for Steam Heating.—Before we define the proposed rule let us make a calculation of what area is required for supplying 100 square feet of radiation, for this is the basis from which the rule is worked. Each square foot of radiation, when the steam in it is at 212 degrees, will lose about 255 units of heat per hour, hence we have to furnish 25,500 units of heat to supply 100 square feet. As each pound of steam loses 966 units in condensing we would have to supply $\frac{25500}{966} = 26.4$ pounds of steam per hour. Each pound of steam at a temperature of 212 degrees occupies space equal to 26.4 cubic feet ; then, 26.4 × 26 4 = 697 cubic feet of steam per hour, to be supplied to radiators containing 100 feet of surface through a pipe 100 feet long.

We can assume the steam as flowing at a velocity of 25 feet per second, which is about correct for steam at atmospheric pressure under these conditions ; then 697 cubic feet per hour is equivalent to $\frac{697}{60} = 11.616$ per minute, or $\frac{11.616}{60} = 0.196$ cubic foot per second, which is about equal to the capacity of a 1¼-inch pipe. In passing steam at this velocity through 100 feet of pipe a considerable loss is occasioned by friction, which we will put at 25 per cent. There will also be a considerable loss by radiation or condensation of steam, which we will also assume is 25 per cent., and this will be the case even if the pipe is well covered. This would give us an area of 1.83, which is rather more than the capacity of a 1½-inch pipe. This accords well with practical experience, for most engineers recommend never to use a horizontal main less than 1½-inch, and for the conditions here given all the heating men with whom the writer has conferred would not risk less than a 2-inch pipe to heat 100 feet of radiation placed at an average of 100 feet from the boiler.

These results establish a sure basis for a calculation of what can be done with a small pipe, and that the proper ratio of area of main for 100 feet of radiation is nearly 2 inches when calculating for 100 feet only. We will now consider a method of changing this ratio to suit any size pipe of larger diameter. It is well known that a large pipe will deliver much more of a given fluid in proportion to its area than will a small one, supposing that in each case the length and pressure are equal, and that this power increases with the diameter. This being a fact we have only to select some constant and divide the diameter by it to obtain the proper ratio for all sizes.

The writer finds that the ratio of the circumference of a pipe to its diameter, 3.141, is the most suitable, because the friction is due to contact with the inner surfaces of the pipe and it decreases directly as the diameter increases. From this we get the rule : The ratio of main pipe for each 100 feet of radiating surface is equal to the quotient obtained by dividing 3.141 by the diameter of the pipe, and may be expressed as follows : $R = \frac{3.141}{D}$ in which R is the ratio and D the diameter of pipe. Then, to ascertain how much radiation we may safely put on any size pipe, we have this expression : $R = \frac{a}{r} \times 100$, in which R is the amount of radiation, a the area of pipe and r the ratio as found in the former expression. By this rule the following ratios are given for the different size pipes, with the area and quantity of surface each size will supply :

Diameter of pipe, inches.	Ratio for each 100 feet of radiation.	Area of pipe.	Quantity of radiation it will supply.
1¼	2.50	1.227	50
1½	2.10	1.767	84
2	1.57	3.141	200
2½	1.25	4.908	400
3	1.04	7.068	700
3½	0.90	9.621	1,062
4	0.79	12.566	1,590
4½	0.70	15.904	2,272
5	0.63	19.635	3,116
6	0.52	28.274	5,424
7	0.45	38.484	8,552
8	0.40	50.265	12,560
9	0.35	63.617	18,175
10	0.31	78.54	25,336
11	0.285	95.03	33,340
12	0.26	113.09	46,600
13	0.24	132.73	55,300
14	0.22	153.93	70,000
15	0.21	176.71	84,000

The size of return pipe cannot be fixed by any definite law of mathematics, for the reason that the return has to do more than carry back the water of condensation. It must be large enough to equalize the pressure in the system. This can only be determined by practical ex-

perience, and it has been found to be from one-third to one-half the area of the feed pipes.

Pipes for Hot Water Heating.—In arranging circulating pipes for a hot water heating plant the conditions are somewhat different than they are for steam. The friction on the water passing through the pipes is much greater than in the case of steam, but as an offset to this the hot water is not affected so much by the loss of heat, hence the results work out for nearly the same size as for steam, except that in the case of hot water the return pipes must be the same size as the feed, and it is to be understood that the sizes given for hot water include both feed and return.

As in the case of steam, we will take as a basis for our calculation 100 feet of radiation. We will assume that each foot of hot water radiation will lose 175 units of heat per hour when working at a temperature of 185 degrees; then, $175 \times 100 = 17{,}500$ units per hour. with a difference of 10 degrees between the flow and return. This would require 1750 pounds of water to supply the lost heat. At 8 25 pounds of water to the gallon this represents 212 gallons per hour, requiring, for a 1¼-inch pipe, a velocity of about 55 feet per minute. We will now assume that the flow and return pipes are 100 feet in length and that there are 12 right angle elbows and a valve on the run.

By Weisbach's formula $(0.0144 + \frac{0.01746}{\sqrt{V}}) \times \frac{l}{d} \times \frac{V^2}{5.4}$

= head or column of water required to overcome friction in a straight pipe, V being the velocity in feet per second, l the length and d the diameter of pipe. This is equal to 0.953 foot head. Now we have 12 quarter-turn elbows and a radiator valve, which is equal to 2 ells, or 14 elbows in all. Each elbow is equal to a loss of head of $\frac{V^2}{2.9} = 0.012$, which, multiplied by 14, equals 0.168 head lost by friction due to the elbows. With 0.953 foot lost by friction in the pipe and 0.168 by elbows the total loss is 1.121 feet. To produce the velocity necessary to supply the quantity of heat required with a 1¼-inch pipe we would need a head of 9 feet, and adding for the loss by friction, 10 feet would be necessary. As we cannot count on such a head, especially for radiators on the ground floor, we have to figure on a larger pipe. With a 1½-inch pipe we can do the work with a head of 4.5 feet, which is about all that can be safely counted on in practice for ground floor radiators. This accords well with experience, as the writer has always found that a radiator of 100 feet on the ground floor needs at least a 1½-inch connection, and in some cases it has been necessary to increase this size before good results were obtained. This figures out practically the same as the rule given for steam pipes; by taking a maximum of 84 feet of surface off a 1½-inch pipe and using that as a basis for fixing the table of sizes, the figures are just the same as for steam.

Application of the Rule for Different Lengths of Mains and for Different Pressures.—For each 100 feet or fraction thereof the mains are extended beyond 100 feet, use the ratio for one size smaller. Thus, if the plant required a 6 inch main for 100 feet, take the ratio of a 5 inch pipe for 200 feet and the ratio of a 4½-inch pipe for 300 feet, and so on.

In the case of pressure the reverse method may be adopted, and for each 2 pounds pressure it is proposed to carry a ratio of one size larger pipe may be taken. Thus, if 2 pounds is to be maintained a 9-inch ratio may be taken in place of 8 inch. If 4 pounds is to be carried the ratio of 10 inch may be taken, and so on.

We have by this formula a simple rule that will meet almost any case found in practice, and while the writer does not claim that the changes of the ratio for the long pipes or higher pressure are mathematically exact, they are conservative and will be found to accord well with practice.

Conclusion.—It seems proper to offer some data to prove the correctness of this formula, and the writer desires to call attention to these facts. The ratio given for small pipes is ample, as can be demonstrated by hundreds of plants in use; the sizes given for pipes from 1½-inch to 2-inch are larger than advocated by any previous writer, and they are twice as large as sizes given by Mr. Baldwin or Mr. Babcock; hence we must assume that on these sizes the rule is safe. We then follow the rule till we come to a 3½-inch pipe, and we strike the same ratio as advocated by Professor Carpenter, of 0.90 inch of ratio for each 100 feet of surface. At the 4 inch pipe we strike the rule of Mr. Baldwin and Mr. Babcock, and between the 8-inch and the 9-inch pipe we strike the ratio of 0.375, as given by Mr. Wolff. With a pressure on the pipes of 10 pounds, on a plant requiring a 10-inch main, the ratio from this rule would be 0.21, as against that of 0.19 given by Mr. Wolff. By this we see that even on large plants the rule is within what has been found safe practice by skilled engineers.

NOTES.

George I. Roberts & Brothers, Incorporated, 471 473 Fourth avenue, New York City, issue an attractive card calendar for the year 1898. The card, measuring 11 x 14 inches, carries a colored picture of their warehouse and of the interior of an engine and dynamo room. Brief reference is made to their stock of Steam, Water, Gas and Engineers' Supplies. The calendar is a neatly printed pad in the middle of the card. The firm also distribute a humorous circular calling attention to the Roberts' Leak Stopper for stopping leaks in steam and water pipes under any pressure.

Charles Brown, one of the oldest and best known residents of Castleton, Vt., died recently at his residence at the age of 82 years, survived by a widow and two children. Mr. Brown originally learned the trade of a tinsmith, and with the progress of the times took up the plumbing trade, and of late years followed the plumbing business exclusively, having worked at it a week previous to his death.

As noted in our trade columns, there is some disturbance in the markets for brass and iron fittings, valves, &c., due to the failure of certain manufacturers to maintain the list prices. It has not as yet affected the smaller trade, however.

A conference was held in Chicago this week between the president of the Western League of Master Plumbers, the president of the Central League of Master Plumbers and a committee from the Central Supply Association.

President A. C. Smith of the Board of Plumbers and Plumbing of Newburg, N. Y., and Plumbing Inspector Drew have been appointed by the board to revise the plumbing code of that city and have it printed in pamphlet form.

William Grady has opened a plumbing steam and gas fitting establishment at 113 Arnold street, Woonsocket, R. I.

Fred. A Wood is exhibiting a new acetylene gas generator in the office of the Electrical Supply Company, 113 North Second street, Cedar Rapids, Iowa.

The plumbing business carried on by the late Robert Mead, Topeka, Kan., will be continued by his three daughters under the management of their husbands, under the firm name of the Mead Plumbing & Steam Heating Company.

A. B. Sproul, New Haven, Conn., has a much finer showroom in his place of business since it has been rebuilt. He now has two fine show windows in which Heating and Plumbing Specialties are conspicuously displayed.

W. E. Kugemann, formerly secretary of the Ideal Boiler Company of Chicago, and latterly with the boiler department of the American Radiator Company, returned to London on the "St. Louis" on Wednesday with Henry S. Downe.

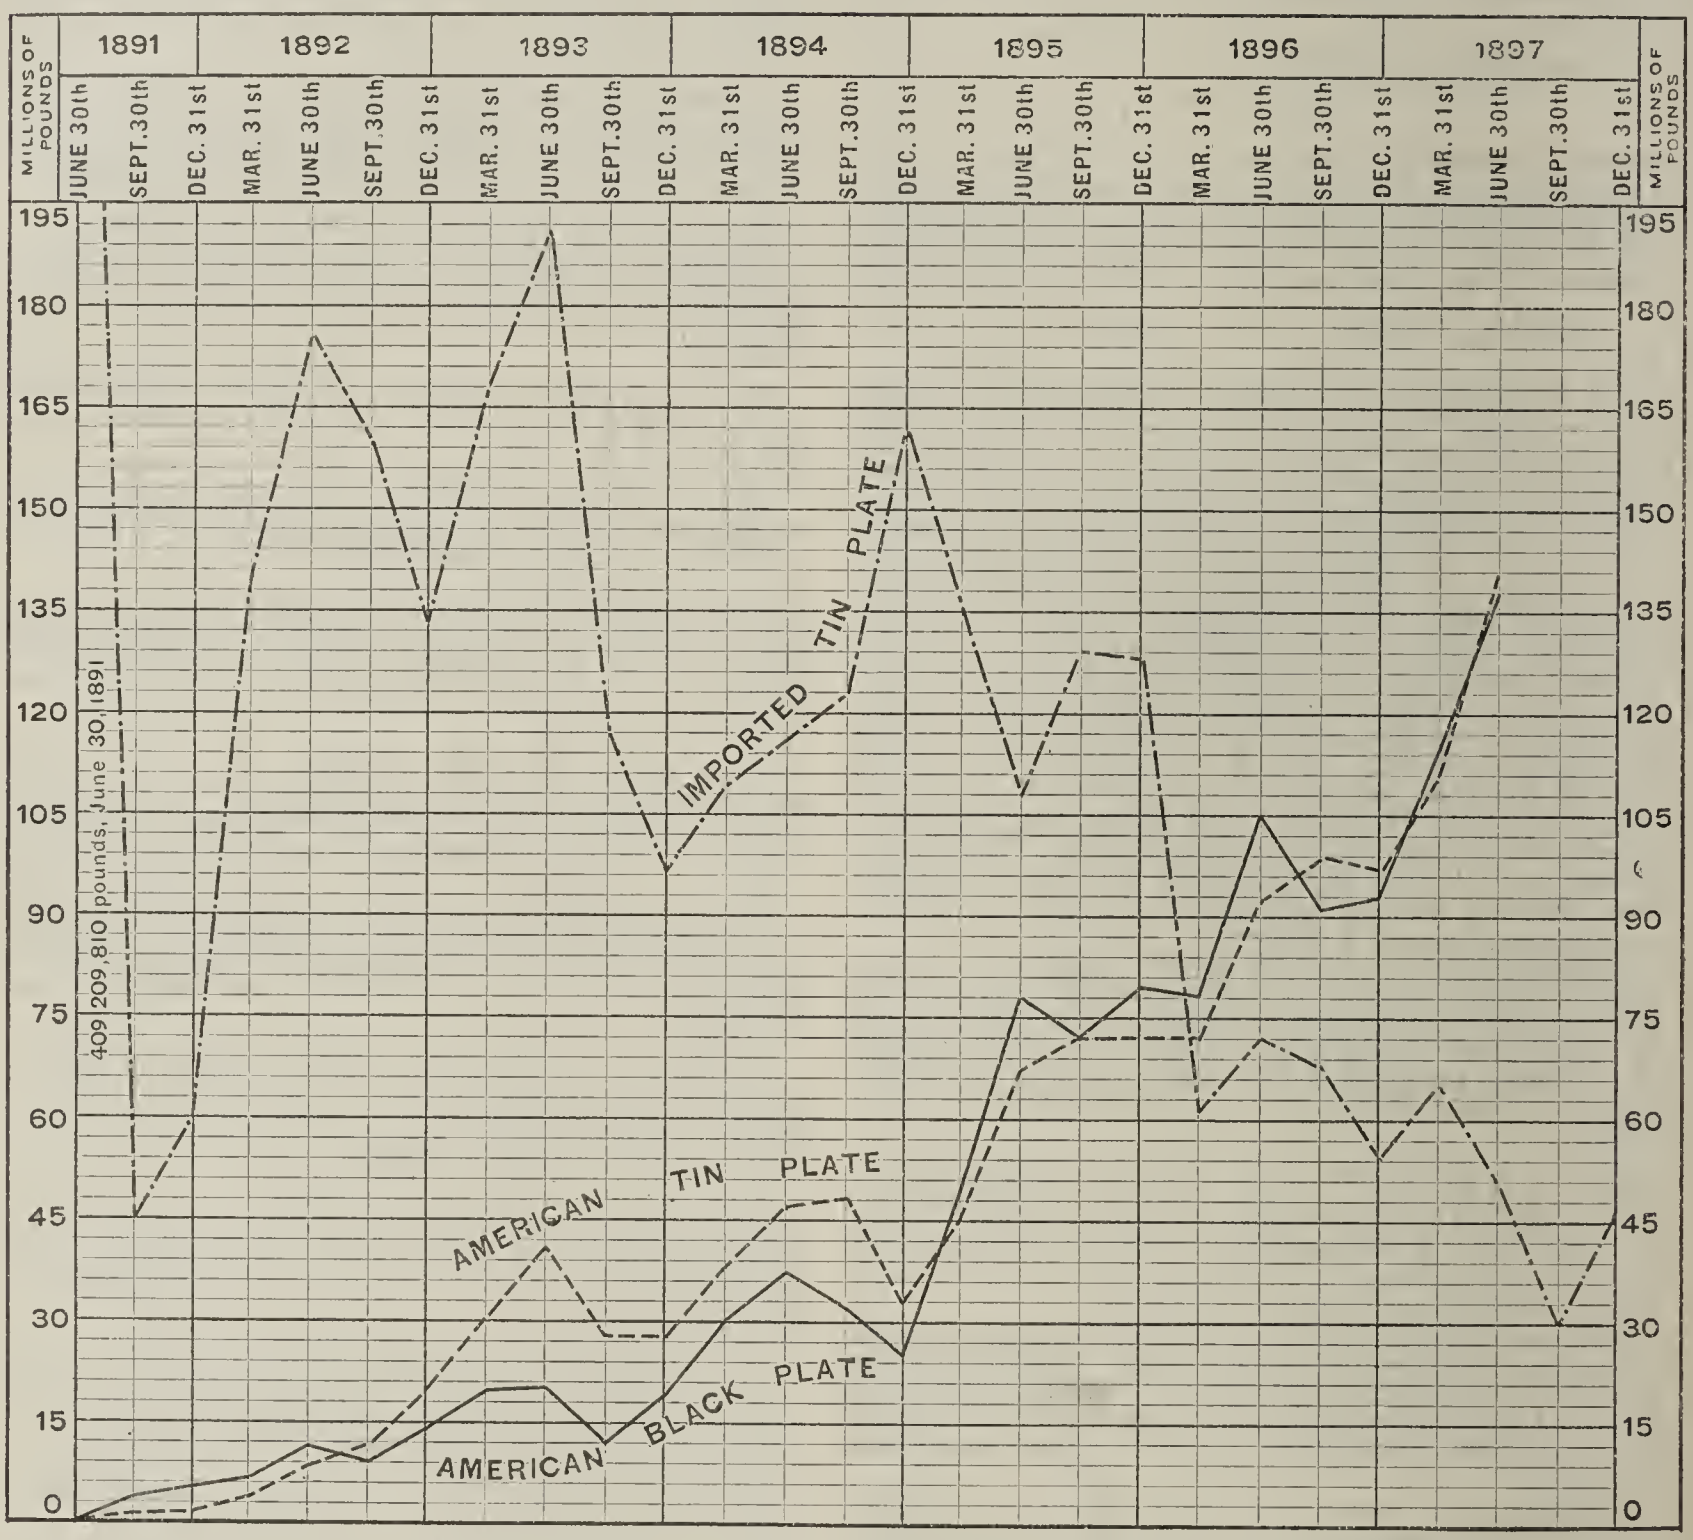
William E. Alford and B. Frank Lawder, January 20, formed a co-partnership under the name of Alford & Lawder, at Baltimore, Md., to carry on a Gas, Electric Fixture and Plumbing business.

The firm of Adams & Co., Mohawk, N. Y., have been dissolved by mutual consent, L. D. Ballard retiring from the partnership. He will, however, have charge of the manufacturing, repairing and plumbing departments for Mr. Adams.

The Reid Brothers Company of Brooklyn, N. Y., have been incorporated by Robert W. Reid, Peter J. Mount and T. C. Horsfield, with a capital stock of $10,000, to manufacture Plumbers' Materials, Steam Fittings, &c.

Dudley D. Norton will, it is reported, early in March start a plumbing establishment in Cazenovia, N. Y.

The seventeenth annual reunion and banquet of the Louisville Master Plumbers was held last week at their rooms in Court place, Louisville, Ky. Vice-President M. J. Duffy officiated as toastmaster, and the Entertainment Committee consisted of George Nolan, P. J. Brogan and J. Isaacs. The officers of the association are: President, W. H. Matlack; vice-president, M. J. Duffy; secretary, John Fleck; treasurer, John Ryan; sergeant-at-arms, J. Shouse.



An advance was announced this week in the price of Galvanized Iron Range Boilers. Particulars of the same are given in the trade report columns of this issue.

R. M. Wilson, Rome, N. Y., has struck a good volume of natural gas on the ground occupied by his bathtub and plumbing goods manufacturing plant, and is preparing to make use of it.

TIN PLATES.

IMPORTATIONS AND DOMESTIC PRODUCTION OF TIN PLATES AND BLACK PLATES.

In *The Metal Worker* of November 28, 1896, we printed a diagram showing the production of American tin plates and black plates from June 30, 1891, to June 30, 1896. We present herewith a similar diagram carrying the domestic production a year later, up to June 30, 1897. We have also introduced what we believe will be scanned with interest, a line showing the course of tin plate imports from the time the McKinley bill went into effect, the first of July, 1891, until the 1st of this January. In the annexed diagram the imported tin plates are indicated by the chain line, the American tin plates by the dotted line and the American black plates by the solid line.

Importations and Domestic Production of Tin Plates and Black Plates

The most extraordinary feature of the diagram is the tremendous drop in importations between June 30 and September 20, 1891; in fact, the figures for the preceding quarter were so great that they would have carried the line far outside of the diagram, and it will be noticed therefore that we have brought the line of imports down from the top, the imports for the preceding quarter having amounted to 409,209,810 pounds. This figure fell in three months to 45,000,000 pounds, the obvious explanation being the new duty which came into effect and the fact that importers rushed their shipments through to get them in before July 1. From September 30, 1891, the imports rapidly rose until the quarter ending June 30, 1892, when they amounted to 175,000,000 pounds. A year later they advanced to 191,000,000 pounds, which is the highest point reached since the beginning of the American industry. From that time imports have declined in an irregular way, reaching the minimum quantity during the quarter ending September 30, 1897, when they were between 30,000,000 and 31,000,000 pounds. The last quarter they rose slightly, which is explained by the fact that there was a good deal of importing done by the oil interest. The line of imports, it will be seen, crossed the line of domestic production in the quarter ending March 31, 1896, since which time the domestic product and imported plates have been getting further and further apart.

It is interesting to trace the course of American black plate and tin plate. Between September 30, 1892, and the beginning of 1895 the tin plate product was a good many

million pounds ahead of the black plate product, due to the use of imported black plates, which were dipped in this country. In the quarter ending March 31, 1895, however, the black plate production got a little ahead of the tin plate production. Roughly speaking, the two have run parallel since then up to last June, and there is every reason to believe that a close approximation still continues between them. During the first six months of this year it will be seen that the lines of production almost coincide.

The Proposed Consolidation

of Tin Plate interests is still a topic of interested discussion in the trade. It is understood that the committee of manufacturers appointed to formulate a plan are quietly working in the matter, although it has not yet progressed beyond the theoretical stage. A large number of makers, however, are said to have expressed their willingness to dispose of their interests at a price. The question of what this price shall be is likely to prove an obstacle of large proportions in the path of the projectors of consolidation. There are many complex interests and considerations to be overcome before such an immense combination as is contemplated could be perfected. Much time and labor will be required to adjust conflicting ideas, and the difficulties to be overcome are so serious as to make many in the trade more than skeptical of the ultimate success of a movement of this character. Still, the idea prevails that, in view of the low prices and the keen competition now existing, some understanding or agreement among the makers is imperatively called for if the trade is to be continued on a basis of reasonable profits.

Welsh Tin Plate Exports in 1897.

Notwithstanding a decline of 27,574 tons in amount and of $1,760,000 in value in the exports of British tin plates to the United States in 1897 as compared with the previous year, the British Board of Trade returns show that the exports of the Welsh product to other countries made so marked a gain last year as to make an increase of 5000 tons in the total export shipments of Welsh plates over the figures for 1896. The gain in value over the previous year's exports, however, was not proportionately substantial, being only about $6000 on a total of $15,186,400. This is accounted for by a decline of about 6 pence a box in the price of the product which took place during the year.

The total quantity of tin plates exported from British ports in 1897 was 271,909 tons. From the subjoined table it will be seen that the most noteworthy increases in shipment were to France, Holland, Russia, the British East Indies and Canada, as well as to "other countries," which heading includes China and Japan. Besides the United States, shipments to Germany, the Argentine Republic and Australasia showed a decline. The following table shows the shipments in 1897 to each country in detail, making comparison with 1896:

To—	Tons. 1896.	1897.
Russia	19,755	30,924
Germany	14,122	11,285
Holland	7,232	8,697
France	11,881	13,896
Portugal, Azores and Madeira	5,191	6,663
Italy	2,916	3,289
Roumania	4,930	5,450
United States	113,049	85,475
Brazil	5,990	6,060
Argentine Republic	5,762	2,475
British East Indies	14,920	22,805
Australasia	15,758	12,252
British North America	17,695	21,863
Other countries	27,742	40,777
Totals	266,963	271,909

We would direct the attention of the readers to the Chicago price-list published in the back of the paper, where they will find quotations of Tin Plates according to the American base box system, which was explained at length in *The Metal Worker* of August 21, 1897. This scheme of quotations has been widely noticed, and some of the largest concerns in Chicago handling Tin Plates are enthusiastic supporters of it. In the East it has, perhaps, attracted less attention, but there are large firms who strongly urge its adoption on reasonable grounds. A very little study will familiarize the buyer with the features of the system and enable him to purchase on that basis without confusion.

SCRAP.

It is reported that the citizens of Hartford City, Ind., are seeking the establishment of a Tin Plate mill at that place.

In its latest report on the British Tin Plate trade the *Iron and Steel Trades Journal* of London says: "Makers just now find much difficulty in quoting for forward delivery, owing to the fear of further labor troubles, and unless masters and men come to an understanding and take common cause in protecting what remains of the Welsh Tin Plate trade there is every probability that it will go from bad to worse. The Americans have built up their Tin Plate trade by prohibitive tariffs, and now they not only have the industry firmly established, but, in contradistinction to our trade, we week by week hear of new mills being erected. Should this continue to any extent we shall hear of the Americans competing with Welsh Tin Plate makers in the neutral markets of the world."

The La Belle Iron Works, Wheeling, W. Va., manufacturers of La Belle Tin and Terne Plates, have almost completed the addition to their Tin Plate plant, which will double their capacity. Among the equipments added are two electric traveling cranes, which are being installed by Pawling & Harnischfeger of Milwaukee, Wis. The cranes are of special make, and are built to stand the heaviest kind of work. Each one is of the three-motor electric type. The Schultz Bridge & Iron Company of McKee's Rocks, Pittsburgh, have the contract for the buildings, all of which will be of steel and iron. A 500 horse-power Corliss engine is also being installed. It is expected to have the additions all completed some time in February, and will give the La Belle Iron Works one of the most complete Tin Plate plants in the country.

The plant of the Pennsylvania Tin Plate Company, New Kensington, Pa., is running full time in all departments, and with excellent prospects for the future. This concern have recently added two new mills to their equipment.

Zug & Co., Limited, of Pittsburgh, are operating their Sheet mills triple turn. This concern have recently installed a plant of fuel gas producers, built by Wm. Swindell & Brothers of Pittsburgh.

A correspondent at San Francisco, Cal., writes as follows, under date of January 17, regarding the outlook for the Tin Plate trade on the Pacific Coast: "There is no doubt that we will have the usual foreign importations of Tin Plate for the year, and no doubt also that the importation of American by rail will be very large. Considerable has come along during the off season, and there will be a rush of it later on in the year. As for price, it will be low, but cannot well be lower than it is now. The consumption will be very large. Notwithstanding the statements put forth early in the year the pack of salmon was greater last year than ever before known on the coast —over 3,000,000 cases or upward of 145,000,000 cans."

The Irondale Steel & Iron Company, Middletown, Ind., now have six mills in full operation manufacturing their Crane brands of Coke and Terne Plates. Recent repairs and improvements have been a success, and the entire plant is in first-class working condition.

A prominent Tin Plate maker is reported to have said that an offer of $100,000 was made at a recent meeting of the manufacturers to any one who could bring about an amalgamation of Tin Plate interests. This indicates the difficulties in the way of consolidation as well as the urgent desire for the adoption of heroic measures to check the downward tendency of prices.

The British Columbia canners have arranged a combination which includes practically all the canneries of any importance in that region.

The Leechburg Foundry & Machine Company of Pittsburgh have received an order from the Shenango Valley Steel Company for 30 doubling shears to be installed in their new Tin Plate plant now being built by them at New Castle, Pa. This is the largest single order for doubling shears ever placed at one time. The Leechburg Foundry & Machine Company have also received an order for a 36-inch doubling shear with engine attached for Norton Brothers of Chicago.

Charles V. McLean, for some years secretary of the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., has resigned his position and has removed to Philadelphia, where he has accepted a position with the *Evening Bulletin*. E. R. Cranford has succeeded to the position of secretary of the above company.

A cable dispatch from Paris, France, announces the death of Ernest Bazin, the inventor of the famous roller steamer.

THE RETAIL STORE.

Barker, Rose & Clinton Company.

Barker, Rose & Clinton Company, Elmira, N. Y., have been incorporated, succeeding the well-known house of Barker, Rose & Gray. The capital stock of the new company is $100,000, fully paid in. Capt. Frederick Barker is the president of the concern. Arthur Clinton vice-president, and Stephen Rose secretary and treasurer. The company will continue the wholesale and retail business in Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting and Athletic Goods, Paints, Oils, Glass, Cordage, &c. The company's establishment is large and well equipped. Their main store, which was built five years ago, is four stories high with basement. It is 64 feet wide by 100 feet in length. Adjoining this building and connected with it are lofts which cover 9000 square feet of floor surface. They also have two warehouses near the depot, one 40 x 140 feet and the other 40 x 72 feet. In the latter they carry their heavy goods, Nails, Glass, Horseshoes, Bar Iron, &c. The company advise us that the condition of business has been very good and that the outlook is much better than at any time during 1897. Under their new name the house will have the best wishes of the trade for their continued prosperity.

Iron Clad Dairy Pail.

Iron Clad Mfg. Company, 22-24 Cliff street, New York, are manufacturing a dairy pail as here illustrated. The feature of the pail as now made is the ear, a detail view

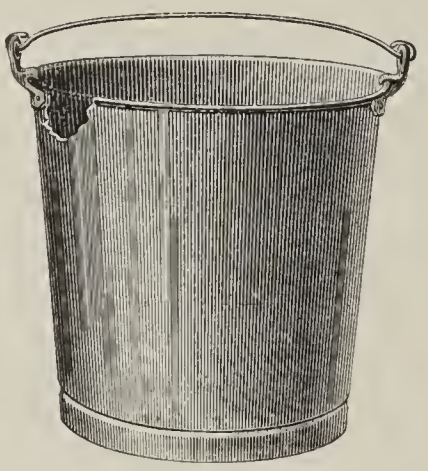


Fig. 1.—Iron Clad Dairy Pail.

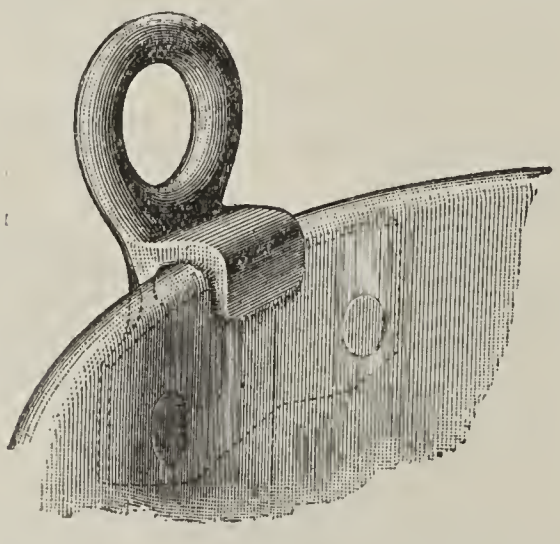
of which is given in Fig. 2. The ear is so made and attached to the body of the pail that the strain from both directions is said to bear on the wire in the rim instead of on the rivets. This, we are told, obviates the annoy-



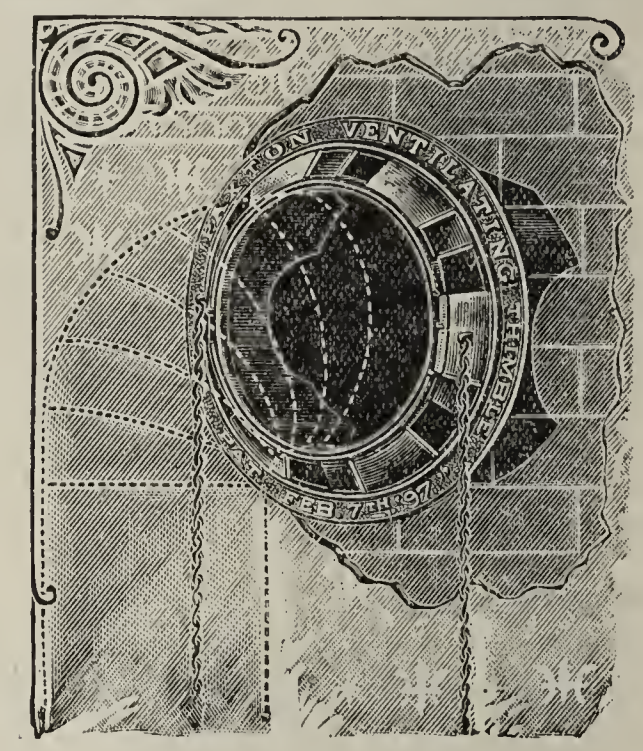


Fig. 2.—Sectional View, Showing Form of New Ear.

ance of ears coming off. The pails are made of IX and IXXX stock, in 10, 12 and 14 quarts capacity each, weighing 17, 20 and 23 pounds, and 23, 26 and 28 pounds to the dozen, respectively.

The Paxton Ventilating Thimble.

The Paxton Hardware Mfg. Company, Paxton, Ill., are sole manufacturers of a device herewith illustrated, which is intended to ventilate any room—kitchen, schoolroom, public hall, &c.—in which a stove pipe is used. It consists of a combined pipe collar and thimble, the collar being provided with openings and a circular revolving

Paxton Ventilating Thimble.

cap with corresponding openings. The cap is revolved by means of chains attached on the sides, as shown in the cut. When open, the draft in the chimney draws through the apertures the smoke, steam or noxious gases in the room. The device is stated to have proved very efficacious under varied circumstances, not checking the draft of the stove, but speedily freeing the room from smoke or odors. The thimble is manufactured in two sizes, 6 and 7 inches, and with japan, oxidized copper or nickel finish.

Ohio Retail Hardware Association.

A meeting of the Executive Committee of the Ohio Retail Hardware Association was held on January 6 at Hotel Chittenden, Columbus, for the purpose of going over the year's work, deciding on dates for the annual meeting and preparing a programme for it. Columbus being by far the most central point in the State and easier of access than any other city, had already been decided on at the last annual meeting as a permanent place of gathering.

Attending the preliminary meeting were J. P. Duffy, president, Greenville; John F. Baker, secretary-treasurer, Dayton; W. A. Remy, Mansfield, and Henry C. Wiseman, Springfield, the latter two constituting the Executive Committee for the year.

The annual meeting was appointed for the same dates as the meeting of last year, February 23 and 24, and at same place, Hotel Chittenden. It was found that some new members had been added during the year, but not nearly so many as could be wished for. The association hopes to see every hustling Hardwareman in Ohio in line within the next month and in attendance at the annual meeting, doing his share to take care of the retail Hardware interests of the State.

Many questions of importance will come up for discussion at the coming convention. There will be a Question Box, and abuses will be taken up with suggestions as to the best methods of correction. There will be short talks, long talks and there will be a banquet. A good pro-

gramme is in preparation. It was the sense of the Executive Committee meeting that since traveling men throughout the State were taking great interest in the association they should be asked to be present in a social way—in a business way if they prefer—submitting lines, samples, prices, &c.

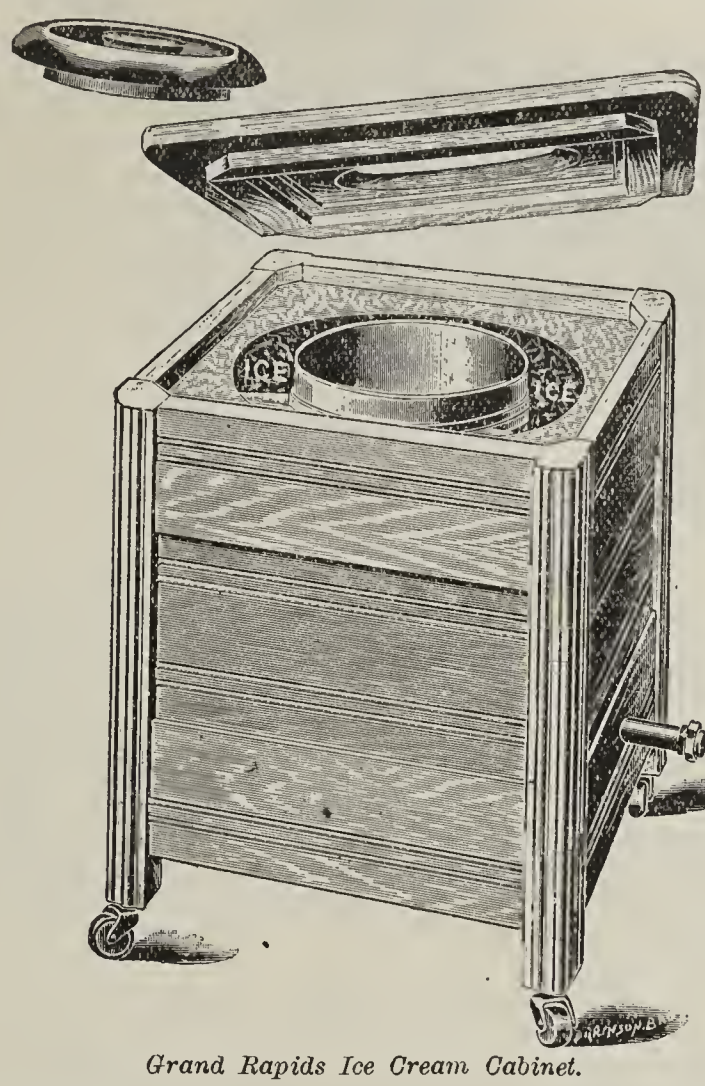
We are advised that everything points to a most successful meeting and large accessions to the membership are anticipated. There are between 600 and 700 Hardwaremen in the State, many of whom are yet unconnected with the association, but it is hoped that the next meeting will see a good proportion of them enrolled as members and lending a helping hand to those who are so valiantly seeking to correct the numerous abuses which have crept into the trade. All the Hardwaremen of the State, whether members of the association or not, are cordially invited to the gathering. The secretary, John F. Baker, Dayton, will cheerfully answer all inquiries.

Wisconsin Retail Hardware Association.

A large attendance is looked for at the annual meeting of the Wisconsin Retail Hardware Association, which is slated for the 2d prox. at the Republican House, Milwaukee. The indications are that the representation will be larger than at any former gathering of the association. The fact that the association has made considerable progress in the direction of correcting the abuses which beset the trade has aroused the members, many of whom are working hard for the success of the organization and making splendid efforts to interest the Hardwaremen of the State who are not at present affiliated with it. A constant increase in interest and membership is reported, and the officials of the association are gratified with the way things are going. They are, however, anxious to broaden the membership as much as possible. The subject of the formation of a Northwestern Association, comprising the associations of half a dozen States in that part of the country, will come up at the meeting, and measures will probably be adopted looking to a conference with the officers of the other associations with a view to forming the organization. Some good papers are also being prepared for the meeting, which will reflect the views of some of the most enterprising and best posted merchants in the State, so that the meeting promises to be a very attractive and noteworthy one. A one and a third fare will be granted by the railroads on the usual conditions.

The Uncle Sam Sprayer.

The sprayer herewith illustrated is an insect and bug exterminator, patent just allowed, manufactured by the Paxton Hardware Mfg. Company, Paxton, Ill. In this



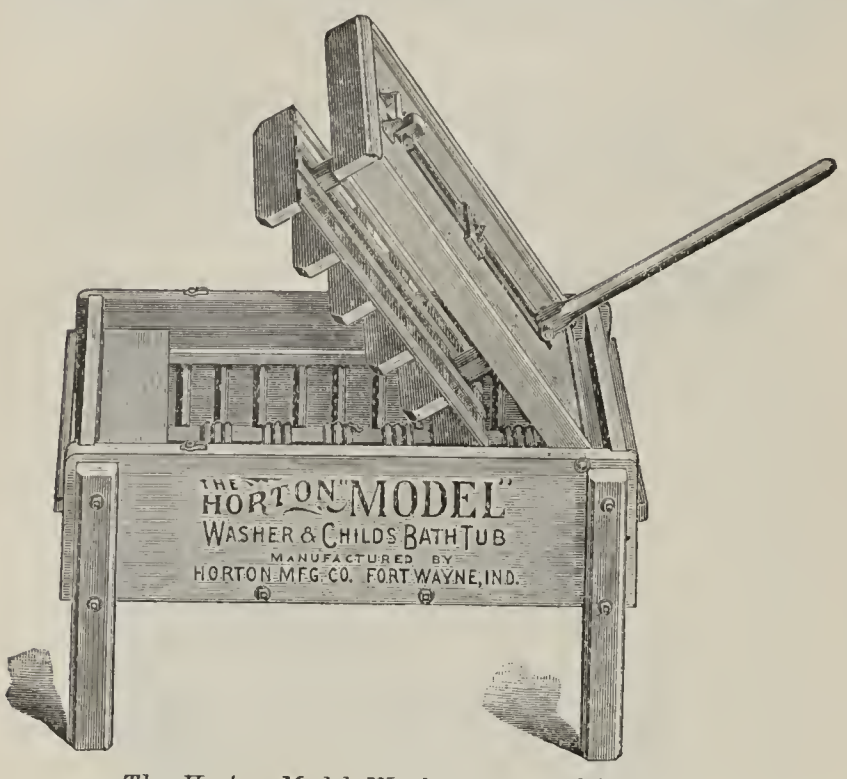
Uncle Sam Sprayer.

device powder or poison is mixed with water in any thickness or strength desired, and is then blown into the largest possible spray. The manufacturers state that it is the most economical device of the kind, spraying all sorts of liquids and can be used for many different purposes, including greenhouse, poultry house, flower garden, vegetable garden, the disinfecting of sick rooms, &c. Its length is 22 inches and it weighs 1 pound.

Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, with branches at 81 Michigan avenue, Chicago, and 87 91 North street, Boston, have just issued a revised illustrated catalogue and price-list of their Agate Nickel-Steel, Pearl Agate, Peerless, Crystal Steel, Blue and White and White Enameled Wares, which covers their entire product in these lines and supersedes all previous lists heretofore issued. The present catalogue, a book of 130 pages, contains several new and useful articles lately added to the assortment of the concern, which now covers almost every conceivable object of household and commercial use that can be formed of enameled metal. It is enriched by nearly 500 cuts of goods and contains a complete index which facilitates immediate reference to any article required. Two pages are devoted to a specific description of Agate Nickel-Steel Ware, which is claimed as the acme of ware for culinary utensils, and certificates of prominent chemists are given testifying to the absolute purity of the coating and its freedom from any injurious ingredient.

Grand Rapids Ice Cream Cabinet.

The Chocolate Cooler Company, Grand Rapids, Mich., have brought out a new line of ice cream cabinets, the



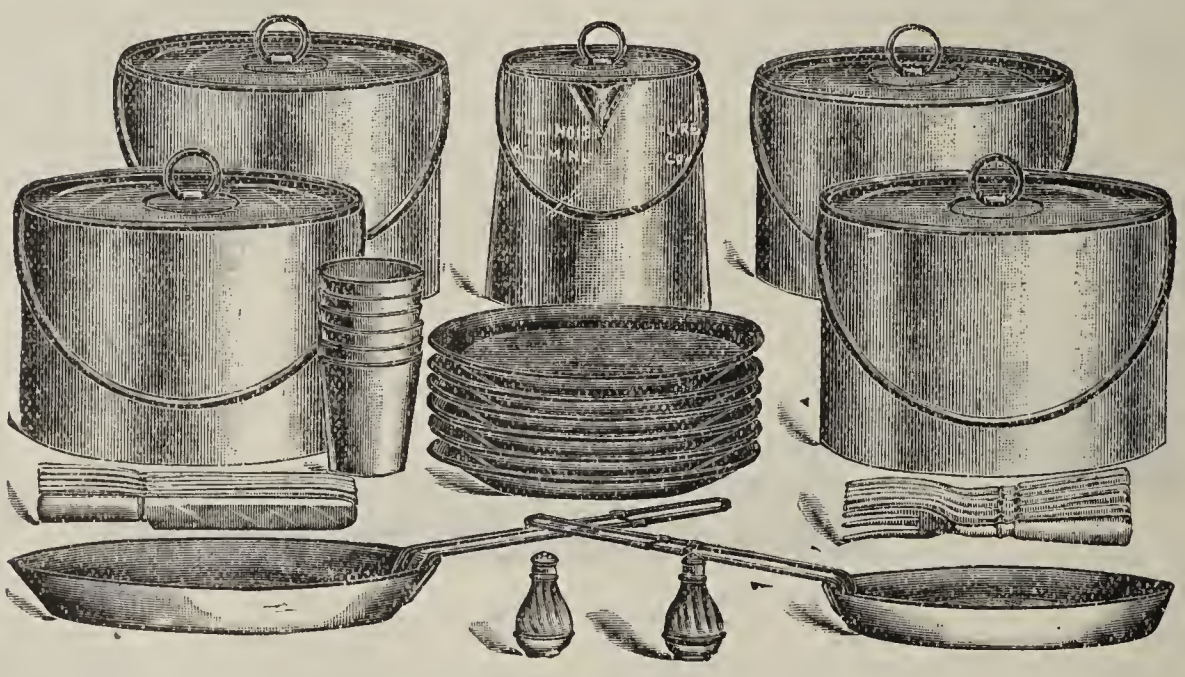
Grand Rapids Ice Cream Cabinet.

accompanying cut showing the 16-quart size. These cabinets are designed for use in connection with soda fountains or in ice cream parlors in place of a tub or pail. They are made of selected oak with solid corners, miter joints, securely doweled heavy covers, extra heavy galvanized iron lining and jacket, brass outlet and cap, and have a fine antique finish. Care has been taken to secure perfect insulation. Between the outer and inner casing are several layers of non-conducting material, while a 1-inch air space extends all round the box, which prevents any sweating. Only the best porcelain lined cans are used, so that there is no danger of taste of rust or tin. This line of cabinets comprises six sizes—namely, from 8 to 40 quarts. Cabinets are also made to hold two cans, three cans and four cans, to meet the demands of those carrying more than one kind of cream.

J. C. Stone, Post Office Drawer 456, Lansing, Mich., has issued a little circular illustrating his Safety Chimney Thimbles and Stove Pipe Fasteners, of which he is both patentee and manufacturer. The goods are described at considerable length, numerous illustrations being presented in order to show how the Fasteners are employed. A complete outfit consists of three pieces, and Mr. Stone suggests that the Safety Chimney Thimbles should be used with every chimney that is built. The goods are being placed on the market through the general hardware trade.

The Horton Model Washer and Child's Bathtub.

An illustration is herewith given of the Horton Model washer, which is also designed for use as a child's bathtub, and is the latest departure in the line of washing machines made by the Horton Mfg. Company, Fort Wayne, Ind., for whom C. M. Avery, 183 Lake street, Chicago, is sales agent. This machine is an improvement over their well-known Western washer in several respects.



The Horton Model Washer and Child's Bathtub.

It not only has increased capacity, but in place of the old style pin wheel rotating in the center of the box the Model washer has a six-paddle dasher which operates the full length of the box. This not only agitates the clothes through the water, just as the pin wheel does to a limited degree, but also dashes the water through the clothes, thereby being doubly effective. The further claim is made that it is a perfectly noiseless machine. It has no gearing or iron parts to clash and rattle or require adjusting. The clothes are prevented from bunching by steel springs, which permit the dasher to raise and clear itself. It is made in one size only.

Aluminum Camp Outfit.

An illustration is presented herewith of one of the six-person aluminum camp outfits manufactured by the Illinois Pure Aluminum Company, Lemont, Ill. This camp

Aluminum Camp Outfit.

outfit is described as manufactured of the finest grade of pure aluminum and as absolutely seamless. There are 4 stewing pans made of heavy material, complete with covers and carrying bails; 1 coffee pot, 6 cups, 6 plates, 2 fry pans with detachable handles, 6 knives, 6 forks and 1 each pepper and salt shaker. The whole outfit nests in the larger pan, making a package 10½ x 7½ inches in size, weighing complete 12 pounds. The aluminum camp outfit is offered as a successful outfit for the Klondike or Alaska gold fields, the metal being very light and at the same time strong and durable. The outfits are made in three sizes—namely, for two persons, three persons and for six persons. The two-person set weighs 4 pounds and when nested is a package 9¾ x 6½ inches in size. The three-person set weighs 6 pounds, making a package when nested 10 x 6¾ inches in size. The six person set weighs 12 pounds and when nested makes a package 10½ x 7½ inches in size.

MEMORANDA.

John Orr, dealer in Hardware and House Furnishing Goods, 2033 Germantown avenue, Philadelphia, is building a new Hardware store which he is confident will be one of the finest stores in the city when completed. The new establishment will be 100 feet long by 16 feet wide, and will have two plate glass show windows. Mr. Orr will also continue his present store, which is 70 x 16 feet in dimensions, his intention being to devote one store to Hardware exclusively and the other to his line of House Furnishing Goods. The new emporium will be thrown open about March 1.

Jas. Watt of Thomasville, Ga., and D. Holmes, formerly of Harley & Holmes, Fitzgerald, Ga., have lately purchased the stock of the Boyd Hardware Company, Fitzgerald, and will organize a stock company under the name of Watt & Holmes Hardware Company. They will carry a full line of Shelf and Heavy Hardware, Mill Supplies, Harness, Tinware, &c.

P. M. Herron, Auburn. N. Y., has taken Peter Herron and William S. Ganey into partnership with him and organized the P. M. Herron Hardware Company. The company will do a wholesale and retail business in Iron, Steel, Shelf and Heavy Hardware, Stoves, Ranges, Furnaces, House Furnishing Goods, Tinware, Paints, &c. They have leased two additional floors over their present store, 34 and 36 Genesee street, and will entirely remodel the interior of the establishment. They will also put in a new two-story plate glass front. When the contemplated improvements are made the company expect to possess one of the best arranged and most convenient Hardware stores in that section of the State.

Barbee & Huncilman have succeeded Huncilman & Co., dealers in Stoves and Tinware, New Albany, Ind. The new firm intend to add a line of Hardware.

The Robinson Hardware Company have lately been organized at Gilroy, Cal., with a capital stock of $30,000. They will retail Stoves, Shelf Hardware, Builders' Supplies, Cutlery, &c.

Meriden Bronze Company, Meriden, Conn., and 30 Park place, New York, have just put on exhibition a new line of gas portables for table and desk use. The concern have been influenced in this addition to their lamp business by the greatly increased demand for incandescent lights with mantles, as made by the Welsbach and other companies. They are now showing 28 different styles in gilt and gold plate, having various styles of ceramic bodies in aurora, art bent glass, onyx, old brass and gold matte, which range in price from $1 to $15 each. Some of the centers are enameled in new colors in tints of gray to blue in the aurora and from cherry to reddish brown in ceramic.

Russia Cement Company, Gloucester, Mass., well known as manufacturers of Le Page's glue, are putting on the market the Essex flower food for house plants and window gardens, and they issue an attractively printed pamphlet of helpful hints for their care and management. This flower food is put up in small packages in handsomely lithographed covers which make showy shelf goods. The packages retail for 10 cents, and afford the hardware dealer a substantial profit. The goods are put up 12 packages in a case, and are accompanied by a beautiful colored hanger for the merchant, free.

STOVE TRADE NOTES.

REVOLUTION AND EVOLUTION OF THE STOVE TRADE.—II.

BY J. B. N.

The steady tread of other lines of business has been on the road leading to such a sharp competition and cutting of profits that the business was not worth the doing and then amalgamation in one form or another followed, so that profit cutting ceased and normal conditions prevailed. Is the stove business well on this road? Has it gone so far that amalgamation in some form, while not perhaps necessary, yet would be expedient? To the observer of events and cause and effect it would seem that there was something ahead of the manufacturers in the stove business of which they have not yet gotten a glimpse. They may have thought of it, they may have dreamed of its possibilities, but just what form it has taken in the mind is quite difficult to define. Something in the past has been happening in a regular, steady and strong force or tide of circumstances that has a meaning. Some of the stove manufacturers who were 10 to 15 years ago a power in the trade are no longer felt, and some are not even in existence, while others are shorn of their power to be aggressive.

Jobbing houses who did a good and large business five to ten years ago are not in existence to day, having been driven out of the trade entirely. Localities that 10 to 15 years ago made a majority of the stoves of the United States to-day make hardly enough to supply their little circle of 100 miles, and do not have vim and aggressiveness enough left in their bones to keep out competitors several hundred miles away. Formerly stoves from the East supplied the West, now stoves from the West are largely supplying the East, and this revolution is increasing.

All of these signs of the times, together with the tendencies of the presnt age to be quicker and move faster, mean something, and what do they mean?

Shall the Eastern manufacturers combine against the West and drive them out of the market, that naturally and by prior occupation belongs to them?

Shall the Pennsylvania manufacturers combine against the West to hold their markets?

Shall the Western manufacturers combine against the inroads which the East sometimes make and the Pennsylvania manufacturers continually make upon their territory?

Shall each section of the country combine against all outsiders and try and hold its own?

If so, then are there not too many manufacturers of stoves in some sections and too few in others, and isn't it a remedy that will necessarily cause a wiping out of existence of some? The fight for existence seems to be on. The stove trade must face it. Other trades have faced it and solved it in their own way, so must the stove trade. The West will not give up its trade to the East. The East will not give up its trade to the West. Is it wise to make it a fight to a finish, or amalgamate and save the best and let the others go?

That forces are working unconsciously toward an evolution of some kind in the stove business is beyond a question. What form it may take the future only can tell. Each man will try and hold on to the last; but couldn't his existence be made easier and more enjoyable to him and more profitable to others if these questions were settled before many a good man and true was driven to the wall?

The Rock Island Stove Company, Rock Island, Ill., have established a branch house at Kansas City, Mo. Geo. W. Blakesley will be manager and has already removed to the scene of his future labors and, it is to be hoped, successes. The establishment of the branch is expected to increase the company's Southwestern business materially.

Beebe Ranges and Furnaces.

The 1898 catalogne of the Beebe ranges and furnaces manufactured by Janes & Kirtland, 110-116 Beekman street, New York City, reaches us printed on fine paper in dark green covers with the address of the house on the first cover and their trade-mark, the word "Beebe," in gilt on the last page. The first illustration shows the Beebe French range, which is of steel construction. This is followed by the Beebe double oven range with four cooking holes over the fire. These ranges have been on the market a considerable time and have established a good reputation. An older pattern of the Beebe range is next shown, and is a type of range which can be found in many of the older first-class residences of the city. The next three pages show the 800 Series of the Beebe ranges, which are of modern type, adapted for builders use, furnished with either right or left hand oven and for the use of either horizontal or vertical boilers. One cut shows the range with high warming closet and the horizontal boiler incased above it. Several pages show Beebe ranges of smaller type, adapted for cheaper buildings. One page is devoted to a patent gas attachment designed to be used in connection with their 800 Series ranges. A three-burner gas hot plate is arranged to swing down on top of the stove when it is not in use with a coal fire, and can be lifted up under the warming shelf and used there to give additional cooking capacity to the range when the coal fire is burning. The next page shows the laundry range with water heating capacity sufficient for a 150-gallon boiler. Two other smaller laundry stoves are illustrated. The department devoted to furnaces is headed by the Beebe brick set furnace, adapted for either hard or soft coal and either portable or brick set. These furnaces are of the all cast iron type, and are followed by another furnace with a different construction of radiator, designed for cheaper trade. The last two pages are devoted to the Beebe furnace, a steel plate radiator and a half-tone engraving showing the furnace in knocked down condition, so that all of the parts may be readily seen. This furnace is made with straight fire pot to prevent the accumulation of ashes, with an anti-clinker revolving grate and a dust flue.

ODD PLATES.

Isaac A. Sheppard & Co. of Philadelphia, Pa., have a unique way of calling the attention of the trade to some of their leading specialties. A week or two since reference was made in these columns to the little pamphlet which they were distributing, discussing the proper method of warming a house, and now we have before us a card which they are sending out stating that "the State of Illinois has practically sanctioned the Paragon Furnace," at least that is the deduction which the manufacturers say may be drawn from the fact that the State University of Illinois has adopted as a text book in its Architectural Department the company's little volume entitled "Hints About Heating." The little work, we understand, is carefully written and represents the labors of an expert. It presents the problem of heating buildings thoroughly, scientifically and practically, leading logically up to the conclusion that the very best way to obtain the end desired is, the manufacturers intimate, by using the Paragon Furnace. The book is sent free to any one sufficiently interested to make application for a copy of it.

Lewis & Wanner, proprietors of the Peerless Steel Range Works, Chicago, Ill., have moved to 201-203 East Lake street, that city, where they have larger quarters and are more centrally located.

J. P. Lindemann & Sons of Milwaukee, Wis., have just issued, in the form of an eight-page folder, an Oven catalogue for 1898. Reference is made to their Stationary Ovens as having established an enviable reputation in the trade, and this year they are being manufactured with all the salient features of last season, but with several new and valuable improvements added. It is stated that the Folding Oven has steadily increased in popularity, while the improved Perfection flue system is referred to as equalizing the heat scientifically and making the Ovens rapid

and thorough in roasting and baking. Messrs. Lindemann & Sons are also general Northwestern agents for the Dangler Process, Gem and Junior Gasoline Stoves and the Wick and Wickless Blue Flame and White Flame Oil Stoves.

The Charter Oak Stove & Range Company of St. Louis, Mo., are distributing what is known as the Charter Oak Illustrated Almanac for 1898. It is a publication of 50 pages, bound in paper covers, and in addition to a large amount of astronomical data there is more or less light literature, some of it of a humorous character, while scattered through the pages are many illustrations of an interesting nature. As the almanac is issued primarily for advertising purposes it is natural to find no little reference to the Charter Oak Stoves and Ranges, the merits of which are set forth in a way to attract the attention both of the dealer and of the housewife.

A series of catchy little advertising novelties have been gotten out by the Standard Lighting Company, Cleveland, Ohio, which will be appreciated by the retailers of their goods. They consist of a dozen or so small drawing books for children, containing outline sketches covered by transparent paper on which copies of the sketches can be made. In each book, the central pictures relate to either the company's New Process Vapor Stove or their Blue Flame Oil Stoves. The covers are ornamented on the front by attractive pictures in colors, while the backs are devoted to advertisements of the New Process and Blue Flame Stoves, a blank being left for the name and address of the dealer at whose store they may be inspected. The company believe these little advertising novelties ought to help the retailer in extending the demand for these goods.

John P. Ley, 239 Water street, New York City, manager of the New York office of Charles Noble & Co., Philadelphia, Pa., showed in his sample rooms recently a fine sample Range which he had prepared for one of his customers. It was their Liberty Square Range, having an oven 20 x 22 inches in size. The Range was set on a nickel plated base and had the edges of the top and bottom nickel plated. The oven door was provided with a nickel name plate bearing the word "Liberty," and a nickel oven shelf. The end of the hearth and the boiler door were also nickel plated. The drop warming table at the oven end of the Range was handsomely nickel plated, and the top and elevated warming shelf and the back were similarly finished. In order to further contribute to the attractions of the Range the oven door, the ash door, the fire door and the end doors of the Range and the upright portion of the top shelf were highly finished in black japan and the relief portions of the ornamentation artistically treated with bronze. The Range was intended for a special window of a customer, and its handsome ornamentation is well calculated to attract attention.

J. G Sorgen, 79 Lake street, Chicago, Ill., manager of the Western branch of the Hart & Crouse Co., Utica, N. Y., attended the meeting of the Society of Heating and Ventilating Engineers, and while in New York paid a visit to the office of *The Metal Worker*.

The new stationery issued from the New York office of the Liberty Stove Works by the resident manager, John P. Ley, has the letter head embossed and printed in a brilliant red ink. At the left is a picture of the Goddess of Liberty and beneath the words "Stoves and Ranges." The words "Manufacturers of Stoves, Ranges, &c.," and the address of the house are also given, making a very attractive letter head. At the left, near the top, the name of William W. Noble appears as general manager. A business card has been prepared similar in appearance, so that those who correspond with the house will recognize at once a representative of the firm when the card is presented.

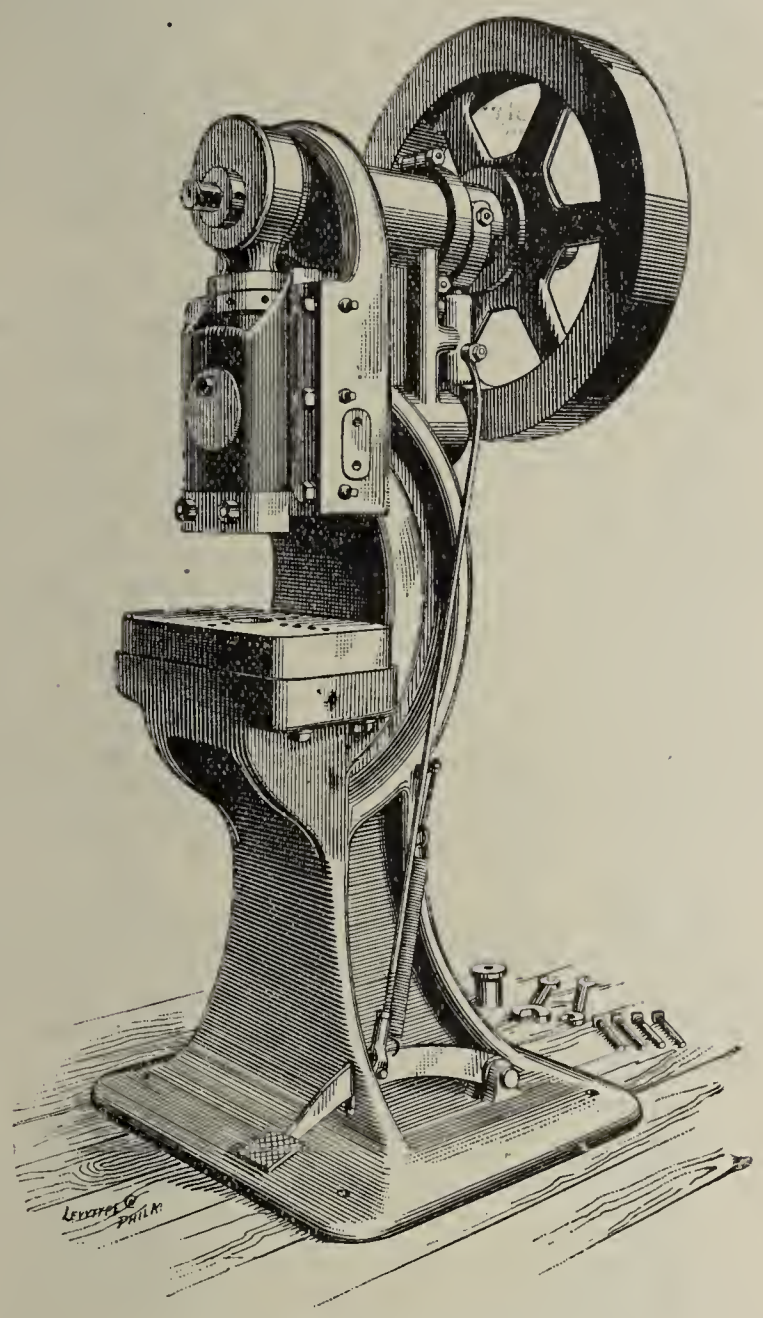
The Century Stove Company of Dighton, Mass., are favoring their friends in the trade with a neat calendar for the new year, the card being embellished with an imposing design in colors, likely to attract attention wherever displayed. A portion of the card is occupied with illustrations of the Century Grand six-hole Range and the Century Sheet Iron Surface Burner. The leaflets for the different months are attached to the card by means of a red cord.

The Fuller & Warren Company, Troy, N. Y., have completed arrangements for the following staff of traveling salesman, who will cover the territory indicated: F. C. Carpenter will look after the interests of the company in Greater New York and New Jersey; C. A. Miller in Northern New York, Vermont and Western Massachusetts; T. H. Harlow in the balance of the New England States; John M. Palmer in Western New York and Northern Pennsylvania, and C. K. Eastwood will travel in Central and Southern New York and a portion of Pennsylvania.

The P. D. Beckwith Estate, proprietors of the Round Oak Stove Works, Dowagiac, Mich., are distributing among their friends in the trade an exceedingly pretty calendar for the new year. A card measuring nearly 11 x 14 inches is embellished with a colored panel 5½ x 8 inches in size, representing a winter scene among the range hills of the Northwest, where the snow lies several inches deep and the wind is rapidly creating heavy drifts. A stalwart bull is the conspicuous feature of the foreground, leading the way for a herd of cattle following in crowded order a short distance behind. This picture, we understand, is an exact reproduction of a painting owned by Mr. and Mrs. Fred. E. Lee, the former being the general manager of the estate, and is presented on the card calendar as illustrating in the very best manner "the constant fearless onward march to greater success which has characterized and made famous the genuine Round Oak." The printed matter, which extends across the center of the card, appears in green and old gold letters, producing a very rich effect. Covering the leaves for the different months of the year is a slip on which it is stated that the calendar is presented with the compliments of the Beckwith Estate, and refers among other things to the fact that new decorations, improvements and additions to the Round Oak family have been perfected for 1898, and these will, it is expected, surprise and highly please the company's customers. The make up of the calendar is, as stated above, exceedingly neat, and there is provided a loop of white silken cord for hanging it up.

The 1898 catalogue and price-list of Registers and Ventilators made by William Highton & Co., Nashua, N. H., is a volume of 36 pages bound in colored paper. The get up of the pamphlet is exceedingly attractive, the paper being fine and the printing neatly done, while a couple of inset leaves of enameled paper show the appearance of bronze and plated register faces. In issuing this catalogue the manufacturers call the attention of their customers to a change in list prices, and request that they destroy all former lists. A very large variety of designs are illustrated in the pages of this volume, the patterns varying from a simple lattice to beautiful and elaborate scroll work. Registers, furthermore, of all types are noted, Vertical Wheel Registers, Round Registers and Ventilators, Convex Ventilators, Lock Vertical Wheel Ventilators, Circular Top Registers, Self Indicating Ventilators, Ceiling Ventilators, Ventilating Plates, &c., being some of the goods enumerated.

The business of William Kerby, whose success in handling Paragon Furnaces and Fidelity Ranges in New York, is well known to the trade, has been purchased by the manufacturers, Isaac A. Sheppard & Co., who will hereafter conduct it at the old stand, 4 and 6 Peck slip, as the New York branch of their extensive foundries in Philadelphia and Baltimore. The sale of goods will be more vigorously pushed than ever before, Mr. Kerby continuing with the firm in the capacity of sales manager, and enlarged facilities being provided for the accommodation of the customers of the house.



The Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago, have issued a bright little pamphlet, very attractively gotten up, which is descriptive of their Gas Ring. This Ring is a device used in the Excelsior Furnaces for the purpose of effecting complete combustion of soft coal and thus render this cheap fuel available in the operation of Furnaces and Heaters. It is stated that the device is thoroughly successful and that by the substitution of soft for anthracite coal, thus rendered practicable, the cost of fuel in many parts of the country has been reduced more than 50 per cent. The inner part of the Excelsior Ring is cast in sections, so that a piece can easily be replaced without disturbing the remainder of the Ring. The Ring is, however, made unusually heavy, so as to avoid the necessity of making frequent repairs. Its construction is also such that it cannot be clogged up.

The Tinware manufactory of F. A. Walsh & Co., at Milwaukee, Wis., was burned on the 22d inst. The factory is located at Thirty-fifth and Vliet streets, just on the western edge of the city limits. The water supply was such that only three engines could be worked and their principal service consisted in protecting adjacent buildings. The structure was 75 x 175 feet and four stories high. When the department arrived the third and fourth floors were burning fiercely and it took only a short time for the flames to reach the other floors. The loss is estimated by Mr. Walsh at $225,000 on stock and machinery and $75,000 on the building. The loss will be high on machinery, Mr. Walsh said, because the firm have to have special machinery for the work. There is an insurance of $250,000.

The Japanese cruiser "Kasagi" was launched at the yards of the William Cramp & Sons Ship & Engine Building Company, Philadelphia, on January 20. The vessel was named by Miss Helen Long, daughter of the Secretary of the Navy.

Improved Punching Press.

We show in the accompanying illustration a general view of a punching press made by the Ayars Machine Company, Salem, N. J., the machine having been designed with special regard for heavy work and durability. It is particularly adapted for punching articles and bars of heavy sheet metals. The shafts are of hammered steel working in long solid scraped bearings. An eccentric is driven on to a tapering bearing and fastened with a steel key and nut. The stroke can be changed to suit the requirements of the work. The ram has long bearings in V-grooves and is connected with the eccentric strap by a threaded steel pitman, which gives 3 inches adjustment to the ram. The bolster plate has holes tapped in it to which the work can be fastened. Two planed surfaces on opposite sides of the press are provided to which strippers, &c.,

Improved Punching Press.

may be bolted. The punch is inclosed in an enlargement of the shaft, which is forged solid. All parts are of steel reversible and hardened, so that durable wearing surfaces can be obtained. The machine is provided with a safety stop so that the shaft can be revolved to any position and the die set without throwing the belt off. The fly wheel is very heavy and has three points for the clutch pin to strike, less than one-third revolution of the wheel, it is stated, being lost before the shaft turns. The presses are made in three sizes, and there are also three sizes of geared presses, the latter being used when the thickness of the material is as great as the diameter of the hole punched and in any case where it is more than ½ inch in thickness.

The American Protective Tariff League.—William L. Strong was elected president of the American Protective Tariff League, to succeed Cornelius N. Bliss, at the recent annual meeting of that organization, held at its headquarters, 135 West Twenty-third street, New York. The other executive officers elected were: First vice-president, Le Grand B. Cannon; second vice-president, Joseph E. Thropp; treasurer, Chester Griswold; general secretary, Wilbur F. Wakeman; Executive Committee, T. M. Ives, New York; P. C. Cheney, New Hampshire; James Phillips, Jr., Massachusetts; William Barbour, New Jersey; Henry C. Valentine, New York. All of these officers were chosen by the new Board of Managers, which is composed as follows: Le Grand B. Cannon, Cornelius N. Bliss, Thomas Dolan of Pennsylvania, P. C. Cheney and Henry McCall of Louisiana. These managers are elected for four years. Secretary Wakeman presented a detailed report of the work done by the organization during 1897. He showed that $33,623.58 had been expended within that period in advancing the cause of protection. The league circulated 652,518 complete tariff documents, including 150,000 copies of the new tariff law.

Salem Nail Company.

The Salem Nail Company, 292 Pearl street, New York, are sending out samples of Cut and Wire Slaters' Nails, galvanized and tinned, and also made of yellow metal. This class of Nails the company make a specialty of, the Nails having large firm heads. They also manufacture Galvanized, Tinned and Copper Nails of various kinds, together with Tacks and Spikes. In this connection the company provide a "quotation card and directory of Nails," upon which is printed in convenient form the sizes and assortment of the different goods manufactured by them, arranged one item to a line, with space for prices. The card is printed with copying ink, and is designed to be filled out by the merchant, indicating the different kinds of goods required, and returned to the manufacturers, who will then quote prices. The goods enumerated include Boat Nails and Boat and Ship Spikes, Round Iron Rods, Hinge Plate or Chute Nails, Swedes Tacks, Zinc Nails and Tacks, Yellow Metal Nails, Nails and Spikes both cut and wire, Slating Nails, wire and cut, both galvanized and tinned, Slaters' Tools, Roofing Nails, Copper Nails, Boat Rivets and Washers, Anchor Nails, Bellows Nails, &c.

Alabama's Mineral Production.

According to Eugene A. Smith, secretary of the Alabama Industrial and Scientific Society, the production of minerals in Alabama during the year 1897, as reported by the producers, is as follows :

Coal	5,114,129	short tons.
Coke	1,252,624	short tons.
Pig iron	839,793	long tons.
Iron ore	2,112,400	long tons.
Limestone	289,973	long tons.
Bauxite	10,539	long tons.
Building stone	133,160	cubic feet.

The returns for brick and pottery were only partial.

FLASHINGS.

A recent report made to his Government by the Austro-Hungarian Consul at Yokohama, Japan, says that the imports of Sheet Iron into that country have increased of late to an extraordinary degree. The material imported was almost entirely of English make, although some came from Belgium, Germany and France. A considerable trade also sprang up last year in Galvanized Iron, which is being extensively used for the construction of factories. Especially large orders were placed by the Government for the building operations being carried out in Formosa. The imports rose about 70 per cent. in amount over the previous year. In this also England was to the fore, only a small amount being credited to Belgium and Germany.

The Cambridge Iron & Steel Company, Cambridge, Ohio, expect to have their two new Sheet mills in operation by April 1. The company are also installing additional annealing furnaces.

The Buffalo Expanded Metal Construction Company have been incorporated at Albany, N. Y., with a capital of $20,000.

The first special exposition devoted to the Acetylene industry is to be opened next April in Berlin, Germany, under the auspices of the German Society for Acetylene and Carbide. A number of contributions in the shape of exhibits and papers to be read at the congress that will be held in connection with the exposition have been promised from Germany and other countries.

It is reported from Berlin that Count Posadowsky, the German Minister of the Interior, is preparing legislation for presentation to the Reichstag to secure uniformity throughout the Empire in the laws relating to labor matters. The aim of the proposed laws is twofold—namely, to

TRADE REPORT.

METAL MARKET.

Pig Tin.—There has been a good steady movement of Tin into the channels of consumption, mostly through direct sales by importers, but wholesale prices have varied in a slight degree only and the market is quite steady. New supplies have been very moderate and below expectations, leaving the local statistical position in better shape than it has been for some time past. Small lots from jobbers' hands are unchanged in price, Straits Pig being quoted at 14½c. per lb.

Copper.—There has been no movement of unusual volume or character the past week, but a very good trade is being effected quietly, particularly on export account, and this has force enough to keep prices quite firm. Orders from domestic consumers were of very ordinary type and of comparatively small proportions individually, although the aggregate was rather better than in recent weeks. Dealers' prices for small lots from stock rule at about 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—A fair amount of business has been transacted during the week, especially in Cornice Copper, but consumers still limit their orders in large measure to current requirements. Buying for stock is not yet in evidence to any extent, although a few good sized contracts are noted. Manufacturers, however, are not generally willing to book orders for extended deliveries, looking for an early improvement in the prices of Manufactured Copper. Small lots of Sheet Copper from store are generally quoted by retailers on the basis of 15c. per lb., but this figure is not adhered to in all cases.

Pig Lead.—Business during the week has been somewhat disappointing, since lots of more than a few carloads were infrequently involved, while the demand from consumers and jobbers alike was tame, in the full meaning of the term. Little beyond a hand to mouth business is reported by dealers, who continue to quote American Pig in retail quantities at 4⅛c. per lb.

St. Louis advices are as follows: This metal continues to show additional weakness. Consumers are, apparently, well supplied, and at this writing are taking little or no interest in the market.

Lead Pipe and Sheet.—The demand for these materials does not yet show any sign of real activity. Sales are principally of small lots for current use and the volume of inquiry is merely moderate. Dullness is the reigning feature of the market, although the outlook for improvement is regarded hopefully. Jobbers in this section quote Pipe at 5½c. and Sheet at 6½c. per lb., subject to the usual trade discount.

Spelter.—Some increase is noted in sales of carload lots, but little if any business in larger quantities has been effected in this quarter. Prices are holding quite steady, however, in the face of heavy production. The consumptive demand in this quarter is of narrow proportions. Galvanizers and brass manufacturers appear to have contracted for their wants ahead some time ago and are not now in the market to any extent as buyers. Retail quotations for good Western brands hold at 4.40c. to 4.50c. per lb.

St. Louis advices are as follows : There is no change to note in Spelter. Consumers are willing to pay producers' prices, but buy only in small lots as their needs require.

Antimony.—There is fully the average jobbing movement and prices are steady at about 7¼c. for Japanese, 7½c. for Hallett's and 8½c. for Cookson's in small parcels.

Nickel.—Business of fair volume is being effected, and small lots remain at 38c. per lb.

Tin Plate.—American Plates have been selling in moderate quantities only. Large consumers have in most instances covered their present and nearby requirements and appear to be holding aloof pending the result of the proposed combination of manufacturers alleged to be under way. The week has been extremely dull so far as large business goes, but some improvement has been developed in the retail trade. The mills are all busy, and in some cases are believed to be accumulating stock, but there is at the moment little pressure to sell for extended delivery in view of the negotiations now pending, which may result in higher prices before long. While wholesale prices are rather weak and some recent sales are reported to have been made at the lowest figures of the year, jobbers' quotations show no appreciable change. Small lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are quoted about as follows, but these rates are not uniformly maintained : American Coke Tins, IC, 108 lbs., 14 x 20; Bessemer Steel, $3.50 to $3.60 ; do., 100 lbs., $3.40 to $3.50 ; do., 95 lbs., $3.35 to $3.45 ; do., 90 lbs., $3.30 to $3.40 ; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75 ; Allaway Grade, IC, 14 x 20, $4.25 ; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are in comparatively light demand, but importers ask former prices in the absence of any radical change in the foreign market.

Sheet Iron.—A slight falling off is noted in the volume of orders from Black Sheets and prices are not quite as strong as last week. Still some large contracts are understood to have been placed lately for both Black and Galvanized Iron, while others, which are pending, are likely to fall in at an early date. Some of the largest mills making Galvanized Sheets are filled up and are declining further orders for nearby shipments. Jobbers complain of considerable slackness in the demand in this vicinity. Small lots from stock are quoted at about 2.35c. to 2.40c. for No. 27 Common Black Sheets, and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows : The Stamping works are now placing heavy contracts for Black Sheets. Several good orders were placed last week, and an inquiry is now in the market for 2000 tons. The Galvanized Sheet trade is quite active, the actual business being reported larger than in Black Sheets. Small lots of Black Sheets from stock are higher, being now quoted at 2.30c. to 2.40c. Galvanized, however, is selling at 80 and 2½ per cent. off.

Old Metals.—An improved demand is reported for home consumption, while the export business keeps up in fairly good volume. Prices are firm, except of Tin Plate Scrap, which is $1 a ton lower. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here.

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8½c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 3 c.
Zinc	per lb. 2½c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	3.50

THE IRON MARKET.

The situation is not essentially different to what it was a week ago. Pig Iron is weak and irregular, while Finished Material of all kinds is in active demand, but without betterment in prices. The volume of business is unprecedented for the time of year, but as a set off to this the capacity for production is also greater than ever before. The important feature is that many lines are now working up to their full capacity, so that if the demand continues, as seems probable, prices ought to be advanced a trifle.

Predictions in times like these have to be made with a good deal of reserve, but it is obvious to the most casual observer that conditions were never so favorable for a satisfactory business as they are to-day. The one objectionable feature is the extremely low prices which are ruling for almost everything in Iron and Steel, but even that is an excellent basis to build upon. It not only insures immunity from outside sources, but enables us to market an immense amount of stuff in other countries, and is in consequence a considerable relief to our own markets. This, moreover, is not likely to be a transient experience unless a materially higher range of prices cuts us off from that class of business.

Except in Pig Iron, the general situation seems to be extremely favorable, and it is believed that events in the

near future will prove that supplies are not in excess of requirements, even though some holders appear to be willing to sell long deliveries at low prices.

Pig Iron.—Lower prices have been made by producers in a good many instances, both in New England and in the New York territory, without leading to the closing of much new business. The Northern furnaces are more generally making concessions than for some time past. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $10.75 to $11.25; No. 2 Plain, $10.50 to $10.75. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

Philadelphia advices indicate that business in Pig Iron in that market has not turned out as favorably as was expected. Buyers are decidedly "offish" and sellers are correspondingly uneasy, and while there is no official announcement of a change in prices, sales are made at pretty much anything that can be mutually agreed upon. There is a kind of understanding that $11 is a bottom figure for No. 2 X Foundry, but it is doubtful if any quantity could be moved at that figure, and in some cases the line has not been drawn even at $10.75. In short the market is badly mixed, but it gives buyers a fine chance to cover their requirements on terms which seemed very unlikely a few weeks ago. General quotations for seaboard delivery are about as follows, with the usual rebate of freight differences at points south or west: No. 1 X Foundry, $12 to $12 25; No. 2 X Foundry, $10.75 to $11.25; No. 2 Plain, $10.50 to $10.60

The Chicago Pig Iron market is reported in good shape, sales being fully up to their shipments. Southern sales agents have also done well latterly in booking orders. Some of them report quite a good business for the week. The price of Lake Superior Charcoal Iron is reported to have settled on a somewhat lower basis, with large transactions following the break. Inquiries for all kinds of Iron are in the market. A special demand has sprung up for No. 3 Iron for use as a substitute for Cast Scrap, which is quite scarce. We quote for cash as follows :

Lake Superior Charcoal	$11.50 to $13.00
Local Coke Foundry, No 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.35 to 10.60
Southern Coke, No. 3	10.10 to 10.30
Southern, No. 1 Soft	10 85 to 11.00
Southern, No. 2 Soft	10.35 to 10.60

In the Pittsburgh district, the Bessemer Pig Iron market continues very dull, and prices are lower. It becomes more evident every day that too much Pig Iron is being made, and production will soon have to be restricted. Foundry Irons are very dull. We quote, f.o.b. Pittsburgh: No. 1 Foundry, $10.40 to $10.50; No. 2, $9.90 to $10; Bessemer, $9.75 to $10, depending on delivery.

Advices from the Cincinnati Pig Iron market are as follows : There is no big run of orders, only a very satisfacory total in tonnage made up of moderate lots, with just enough of sufficient magnitude to show that the big buyers are not asleep. Judging by the current rate of consumption and the number of inquiries in the market there is every indication that business will not slacken for some considerable time to come. The adverse conditions are that the market is unsteady as to price-list, and while perhaps a trifle more settled than a week ago, yet it is still more favorable to the buyer than to the furnaces. In the Northern field conditions are unchanged and the market is irregular and weak. There is no reason for changing the present price-list, though it is perhaps as much honored in the breach as in the observance. Quotations are as follows, f.o.b. Cincinnati :

Southern Coke, No. 1	$10.00 to ....
Southern Coke, No. 2	9.50 to ....
Southern Coke, No. 3	9.00 to $9.25
Southern Coke, No. 1 Soft	9.75 to ....
Southern Coke, No. 2 Soft	9.50 to ....
Southern Coke, Gray Forge	9.00 to ....
Southern Coke, Mottled	8.75 to ....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

In St. Louis the movement in Pig Iron continues to expand from week to week. Sales during the week under review were numerous, and while none were particularly heavy yet the demand, emanating as it has from all quarters, indicates that comparatively few consumers have any large stocks on hand. Prices are firmly maintained, and some furnaces who are sold up some months ahead are asking an advance. We quote as follows for cash, f.o.b. St. Louis :

Southern, No. 1 Foundry	$10.25 to $10.75
Southern, No. 2 Foundry	10.00 to 10.25
Southern, No. 3 Foundry	9.75 to 10.00
No. 1 Soft	10.00 to 10.25
No. 2 Soft	9.75 to 10.00

CHICAGO REPORT.

Scrap.—Cast Scrap is very scarce and has advanced in price. Other kinds of Old Material are in improving demand. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.50	....
Malleable Cast	6 50	....
Stove Plate (free of burnt)	5.50	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—Business continues in the same old rut. The ruling prices of carload lots of 12 tons minimum are as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.00	$5.25
Milwaukee, Wis	5.00	5.25
Kansas City, Mo	7.00	7.25
Council Bluffs, Iowa	7.00	7.25
Lincoln, Neb	7.15	7.40
Sioux City, Iowa	7.50	7.75
Aberdeen, S. Dak	8.25	8.50
Dubuque, Iowa	6.30	6.65
Madison, Wis	6.50	6.75
St. Paul, Minn	7.50	7.75
Burlington, Iowa	6.50	6.75
Des Moines, Iowa	7.00	7.25
Davenport, Iowa	6.30	6.65
St. Joseph, Mo	7.00	7.25
Leavenworth, Kan.	7.00	7.25
Omaha, Neb	7.00	7 25

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

German emigration last year was the lowest since 1874, aggregating only 22,220 persons, against 32,114 persons in 1896. Since 1893, when 87,577 persons emigrated from the Fatherland, the decline has been steady.
render extended strikes more difficult and to enable the authorities to have more control over strike leaders and labor delegates. Recently a laborer at Ronneburg was sentenced to a year in jail for calling a non-union man an offensive name, while at Lubeck a striker was sentenced to nine months in jail for tearing up the time slips of two non-union workers.

A semi-official announcement from Rome states that the Italian Government has caused a proposal for a treaty of commerce to be presented to the Government of the United States.

A bill has been introduced in the New York State Assembly to assure to the New York & New Jersey Tunnel Company a perpetual franchise for the construction and operation of their underground road from the terminus of the Long Island Railroad at Flatbush avenue, in Brooklyn, to Cortlandt and Church streets, Manhattan. At present the charter only allows a 25-year franchise, and the officials of the tunnel company allege that the undertaking involves such a large capital, probably $7,000,000 or $8,000,000, and in connection with the Atlantic avenue improvement not less than $10,000,000, that they will not invest their money on any such basis as a 25-year franchise.

The Russian Government has lately placed a contract with the Compagnie de Fives-Lille, of Paris, France, for 80 locomotives for the East Chinese Railway.

THE HARDWARE TRADE.

There have been few developments of importance in the Hardware market during the past week. Trade in the Eastern part of the country is showing some improvement and a general confidence prevails, but in the West the improvement is more marked, though checked somewhat temporarily by storms and severe weather. Travelers who are now generally visiting their customers report on the whole a hopeful feeling, with indications of increased activity in building and the re sumption of enterprise among the people. In sections where, owing to abundant crops marketed at good prices, money is plentiful, there is naturally special promise for business. Prices are without notable change, but the market continues steady, with perhaps a slight weakness in a few lines. Both manufacturers and merchants are taking a hopeful view of the outlook.

Advices from Chicago.—The condition of the Shelf Hardware trade, which had been exceedingly good up to the middle of last week, has since then been unfavorably affected by the heavy storms which have prevailed throughout the Northwest. The first really severe general snow storm of the season has visited this region. Trains are delayed, mails are necessarily irregular and difficulty is experienced in traveling by the salesmen. Other influences than the weather are also affecting trade in Tinware and Metals, this branch of business being quite dull. The demand for staple goods in Shelf Hardware has recently been heavy for the season and it is expected that the volume of business in this direction will continue to increase with the approach of the time to expect spring trade.

Advices from St. Louis.—The Hardware trade continues to maintain the pace at which it started at the opening of the year. The demand is not confined to any particular class of goods, but general assortments are the rule. Dealers in farming communities are sending in substantial orders and report the outlook as being extremely promising. An encouraging feature of the demand is the heavy orders received for Builders' Hardware and general Mechanics' Tools, which is the best indication of returning prosperity. Collections are good.

NOTES ON PRICES.

Wire Nails.—During the past week the market for Wire Nails has been in about the same condition as for several weeks. The demand is fair, but not especially heavy, the trade not being disposed to buy in a speculative way, and yet placing orders enough to cover their early requirements.

Advices from Chicago.—Manufacturers report heavy shipments fully up to their output, with a constant stream of inquiries coming from all classes of buyers. The outlook is very good and no decline in prices is now feared. Jobbers are continuing to sell at the old rate of $1.60 for small lots.

Advices from St. Louis.—The market continues to be extremely active. Mills report a heavy inquiry for deliveries extending over the next three months, but are not disposed to book orders except for shipment during the current month. Prices are well maintained. Jobbers are asking $1.65 to $1.70 for small lots from store.

Cut Nails.—The Cut Nail market continues steady. The volume of business is measured by the needs of the trade.

Advices from Chicago.—This branch of trade has shown no change whatever, small lots continuing to sell at $1.45.

Advices from St. Louis.—There is no improvement to note in the demand for Cut Nails. Jobbers are asking $1.45, base, for small lots from store.

Barb Wire.—The demand is referred to as good for the season, and manufacturers are anticipating an early and a heavy business.

Advices from Chicago.—The movement is reported to be fairly up to the expectations of manufacturers, who are running their mills to full capacity and at the same time accumulating no stock. Barb Wire is moving out freely in mixed carloads with Wire Nails. The demand from the retail trade is very good for the season. Small lots from stock are quoted by jobbers at $1.60 for Painted and $1.90 for Galvanized.

Advices from St. Louis.—The market shows decided activity. The buying has commenced earlier than usual, and mills and jobbers alike report the volume considerably heavier than usual at this season. Jobbers report an active trade, and for small lots quote $1.70 for Painted, with the usual advance for Galvanized.

Smooth Wire.—The market for Smooth Wire is without special feature, and is perhaps on the whole not quite so strong as it has been.

Wrought Iron Pipe.—The market for Wrought Iron Pipe has continued fairly steady during the week, there being an active demand but some irregularity in prices. Merchant Boiler Tubes are in large demand and are quoted as follows: Sizes 2 to 2½ inches, discount 72½ per cent.; sizes 2½ to 6 inches, discount 75 per cent. Charcoal Iron Boiler Tubes are quoted as follows: Sizes 2 to 2¼ inches, discount 65 per cent.; sizes 2½ to 6 inches, discount 70 per cent.

Dover Egg Beaters.—Dover Stamping Company, Boston, Mass., announce a reduction in the price of Genuine Dover Egg Beaters as follows: New Dover (Dover Stamping Company), per dozen 75 cents, per gross $7; Dover Extra, family size, per dozen $2.

Arcade Mfg. Company.—Under date January 18, 1898, Arcade Mfg. Company, Freeport, Ill., have issued a sheet of net prices and discounts applying to their 1897 catalogue.

Brass and Iron Fittings, Valves, &c.—In consequence of the withdrawal of two prominent members of the association of manufacturers of Brass and Iron Fittings, Valves, &c., the market is for the present at least practically open and manufacturers' prices are somewhat irregular. Efforts are, however, being put forth to restore harmony, but there appears to be in the minds of the trade some doubt of the success of the efforts in this direction. Meanwhile, however, retail prices for these goods in this vicinity have not been changed, although there is a possibility of a reduction in the near future.

Range Boilers.—An advance of about 5 per cent. has been made this week in the price of Galvanized Iron Range Boilers. The following are the new retail discounts on these goods:

	Per cent.
Galvanized Iron Range Boilers to and including 52-gallon	65 and 5
Galvanized Iron Range Boilers above 52-gallon	60

L. & G. Enameled Ware.—The January, 1898, price-list of Enameled Ware just issued by Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, superceding all previous lists issued by them, contains the following discounts:

	Per cent.
Agate Nickel-Steel Ware	40
Pearl Agate Ware	40
Peerless Ware	70
Crystal Steel Ware	50
Blue and White Ware	50
White Ware	33⅓

A. B. C. Beam Clamp.—Elsewhere in this issue is an illustrated description of the A. B. C. Beam Clamp, made by the Illinois Malleable Iron Company, 30-32 West Monroe street, Chicago. The price of these hangers is 40 cents each, with a discount to the trade.

Glass.—The demand from factories is reported as being such as to keep Glass moving rapidly for some time to come. It is questionable, however, whether the demand is equal to the output of both association and independent factories. To stimulate the placing of large orders for Glass the American Glass Company have made inducements of extra discounts for certain quantities of Glass purchased by April 1, for both Atlantic Coast and interior points.

White Lead.—There has been a further rise in the price of Linseed Oil, due to the enhanced cost of raw material, and higher prices for Lead in Oil are more confidently looked for. Up to the present date, however, the producers have held to their former prices. Orders are not coming in unusually free, however, and the demand is as tame as it was when Oil cost 4c. to 6c. per gallon less than it does at the present time. In Dry Lead there is only ordinary business for the season and no unusual demand, while prices remain without change of importance.

Red Lead.—Red Lead has been selling in ordinary way only, and prices have undergone no important variation.

Linseed Oil.—There has been a further sharp advance in the price of raw material, and all producers of Oils have raised their prices to partially correspond. Retail quantities are selling at 45c. to 46c. per gallon for Raw and 47c. to 48c. for Boiled.

Spirits Turpentine.—Under very steady trade demand and good holding here and at Southern points, prices have advanced about ½c. per gallon. Small quantities sell from store at about 36c. per gallon.

The launching of the new battle ships "Kearsarge" and "Kentucky" from the Newport News Company's yards has been postponed until March.

Pig Iron Production in 1897.

The American Iron and Steel Association has received from the manufacturers complete returns of the production of pig iron in the United States in 1897, and also complete returns of the stocks of unsold pig iron in the hands of makers or their agents at the close of the year.

The total production of pig iron in 1897 was 9,652,680 gross tons, against 8,623,127 tons in 1896, 9,446,308 tons in 1895, 6,657,388 tons in 1894, 7,124,502 tons in 1893, 9,157,000 tons in 1892, 8,279,870 tons in 1891 and 9,202,703 tons in 1890. The production in 1897 was 1,029,553 tons more than in 1896, an increase of almost 12 per cent. The increase was almost wholly in the last half of 1897, as will be seen from the following table of half yearly production in the last four years:

Periods.	1894.	1895.	1896.	1897.
First half	2,717,983	4,087,558	4,976,236	4,403,476
Second half	3,939,405	5,358,750	3,646,891	5,249,204
Totals	6,657,388	9,446,308	8,623,127	9,652,680

Large as was the production of pig iron in the second half of 1897 it was exceeded in the second half of 1895 by 109,546 tons.

Territorially distributed the production of coke and anthracite iron was as follows in gross tons:

	First half 1897.	Second half 1897.	Year 1897.
New York	106,301	131,623	237,924
New Jersey	37,863	57,833	95,696
Pennsylvania	2,148,700	2,480,946	4,629,646
Maryland	79,212	109,910	189,122
Virginia	153,252	154,138	307,390
Alabama	429,742	503,176	932,918
West Virginia	53,735	79,172	132,907
Kentucky	17,185	18,714	35,899
Tennessee	126,893	120,810	247,703
Ohio	590,922	774,160	1,365,082
Illinois	519,671	597,568	1,117,239
Wisconsin	15,243	71,749	86,992
Missouri	.....	12,369	12,369
Colorado	.....	6,582	6,582
Totals, 1897	4,278,719	5,118,750	9,397,469
Totals, 1896	4,839,539	3,473,344	8,312,883

The production in some of the different districts of Pennsylvania and Ohio was as follows:

	First half 1897.	Second half 1897.	Year 1897.
Pennsylvania:			
Lehigh Valley	157,705	116,916	274,621
Schuylkill Valley	163,446	112,279	275,725
Upper Susquehanna Valley	40,222	51,079	91,301
Lower Susquehanna Valley	98,771	149,163	247,934
Juniata Valley	41,389	31,353	72,742
Shenango Valley	221,044	325,411	546,455
Allegheny County	1,211,883	1,451,210	2,663,093
Miscellaneous bituminous	214,240	243,535	457,775
Charcoal	552	1,436	1,988
Ohio:			
Mahoning Valley	265,331	316,965	582,296
Hocking Valley	2,420	.....	2,420
Lake Counties	127,259	174,571	301,830
Miscellaneous bituminous	147,247	225,375	372,622
Hanging Rock bituminous	48,665	57,249	105,914
Hanging Rock charcoal	3,040	4,767	7,807

The production of Bessemer pig iron in 1897 was 5,795,584 tons, against 4,654,955 tons in 1896, and 5,623,695 tons in 1895. The increase in 1897 over 1896 was 1,140,629 tons. The production of basic pig iron in 1897 was 556,391 tons, against 336,403 tons in 1896. The production of 1897 was distributed as follows: New York and New Jersey, 79,041 tons; Allegheny County, Pennsylvania, 265,548 tons; other counties in Pennsylvania, 84,520 tons; Maryland, Virginia and Alabama, 97,562 tons, and Ohio, Illinois, Wisconsin and Missouri, 29,720 tons.

Production of Bessemer Pig Iron.

	First half 1897.	Second half 1897.	Year 1897.
Pennsylvania:			
Lehigh Valley	59,718	46,767	106,485
Schuylkill Valley	32,833	38,390	71,223
Upper Susquehanna Valley	40,222	51,079	91,301
Lower Susquehanna Valley	87,956	121,098	209,054
Shenango Valley	165,311	287,814	453,125
Allegheny County	965,219	1,225,384	2,190,603
Miscellaneous bituminous	151,960	161,179	313,139
Ohio:			
Mahoning Valley and Hanging Rock bituminous	155,248	231,270	386,518
Hocking Valley	2,420	.....	2,420
Lake counties	118,304	159,005	277,309
Miscellaneous bituminous	140,810	220,840	361,650
Maryland	58,222	92,883	151,105
West Virginia	53,735	79,172	132,907
Illinois	461,917	556,074	1,017,991
Michigan and Wisconsin	2,103	17,069	19,172
Missouri	.....	5,000	5,000
Colorado	.....	6,582	6,582
Totals	2,495,978	3,299,606	5,795,584

The total production of Pennsylvania was 1,503,219 tons during the first half and 1,931,711 tons during the second half, a total of 3 434,930 tons. For Ohio the figures are respectively 416,782, 611,115 and 1,027,897 tons.

The production of charcoal pig iron in 1897 was 255,211 tons, against 310,244 tons in 1896, a decrease of 55,033 tons. The production of spiegeleisen and ferromanganese in 1897 was 173,695 tons, against 131,940 tons in 1896 and 171,724 tons in 1895.

The limestone consumed for fluxing purposes by the blast furnaces in 1897 in the production of 9,652,680 tons of pig iron amounted to 4,247,688 gross tons, of which 3,680,666 tons were consumed by the bituminous coal and coke furnaces in the production of 8,464,692 tons of pig iron, 524 271 tons by the anthracite and mixed anthracite and coke furnaces in the production of 932,777 tons, and 42,751 tons by the charcoal furnaces in the production of 255,211 tons.

The stocks of pig iron which were unsold in the hands of manufacturers or their agents on December 31, 1897, and which were not intended for their own consumption, amounted to 656,489 gross tons, against 827,163 tons which were similarly held on June 30, 1897, and 711,649 tons on December 31, 1896. These figures of unsold stocks do not include pig iron sold and not removed from the furnace bank, nor pig iron manufactured by rolling mill proprietors for their own use.

In addition to the stocks of pig iron above noted as unsold on December 31, 1897, there should be added 218,489 tons in the yards of the American Pig Iron Storage Warrant Company, which had passed out of the hands of the makers, making 874,978 tons which may be said to have been then on the market, against 973,678 tons which were similarly held on June 30, 1897, and 847,686 tons on December 31, 1896. The total quantity of stocks in warrant yards on December 31, 1897, was 275,800 tons, against 221,600 tons on June 30, 1897, and 200,790 tons on December 31, 1896.

—A PROFESSOR at one of our universities," says *The Christian Work*, "is the subject of a queer anecdote. Last winter he was married, and went to housekeeping outside town. This spring he thought he would add a few hens to his stock; he always had a dog. He set a couple of hens, and in good time had two large broods of chickens. He was very proud of them, but in a week or so the fowls began to die. The professor called in a neighbor to look at the chickens and offer advice. They were certainly a dilapidated lot of chickens that the neighbor viewed. They were thin, and apparently without ambition.

"'What do you feed them?' asked the neighbor, after a brief survey.

"'Feed them?' responded the professor, as though he didn't hear right. 'Why, I don't feed them anything, I thought the old hens had enough milk for them.'"—*N. Y. Tribune.*

—"SORE throat, eh?" said the surgeon to a member of a military band, according to the *Chicago News*. "Let me see. Oh, that's not so bad. A slight irritation—nothing more. You'll be all right in a day or two. I think you had better take no risk in renewing the trouble by using your throat, though, so I will recommend you for a fortnight's sick leave." Armed with the surgeon's certificate, the bandsman obtained his two weeks' sick leave. The two weeks had just come to an end, when he met the surgeon on the parade ground. The bandsman saluted. The surgeon recognized the face and stopped. "How's the throat?" he asked pleasantly. "It's quite well, sir," was the reply. "That's good," said the surgeon. "You can get back to your duty without fear. By-the-way, what instrument do you handle in the band?" "The small drum, sir," said the musician.

—BEFORE the days of chloroform there was a quack in San Francisco who advertised tooth-drawing without pain. The patient was placed in a chair and a wrench given, when he roared violently. "I thought you said there was no pain." "So there is not by my process. That is Cartwright's way. That's the way he does it. It's very different from mine." Another tug, and a still more violent howl. "That's the way Dumerge pulls teeth," said the unabashed practitioner. "You don't like it, no doubt. Who would?" Another twist was given, and the patient, as a rule, howled worse than ever. "That," the dentist says, "is Parkinson's mode." By this time the tooth was nearly out. "I will now," he said, "display my own method," whereupon he triumphantly withdrew the tooth and held it up for inspection. "You observe that by my truly scientific process there is really no pain whatever."—*N. Y. Tribune.*

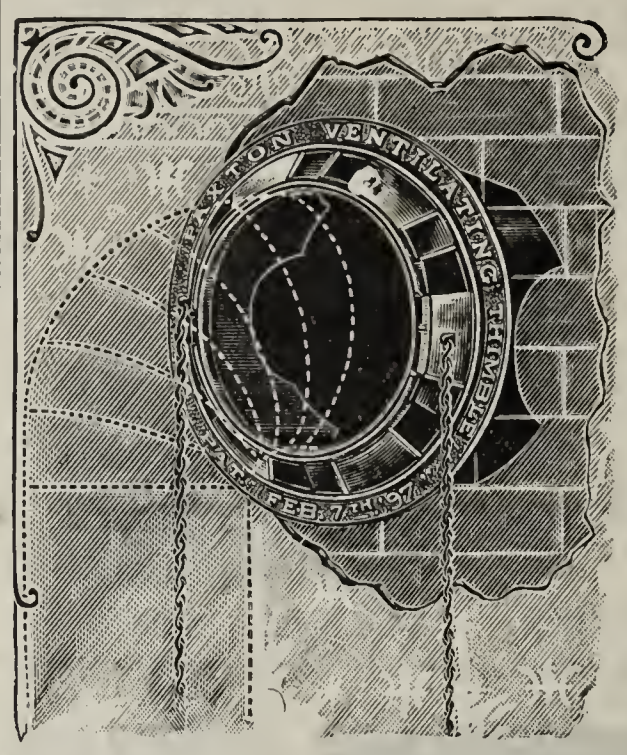
A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.



The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

Our facilities for business were never better. All correspondence given prompt attention.

Factory at GERMANTOWN JUNCTION, | *Office and Stores, 231 and 237 ARCH STREET,*

PHILADELPHIA.

It's strange

how people run after cheap goods, and yet half the time they are encouraged to do so by an army of dealers who carry and push stock which appeals only to cheap trade. Selling trashy goods generally means small profits. You can't make much money on poor tinware, and a little sound talk will always convince a customer that a better article brings true economy in its wake. *That better article,* when made from GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES, becomes representative of the highest grade of perfection in the tinners' art, and may always be *guaranteed* to outlast any similar article made from other plates.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

GUMMEY, McFARLAND & CO., Philadelphia.

Send for Catalogue and Prices.

Anchor . . Ventilators

ARE SUPERIOR TO ALL OTHERS.

Are stormproof and durable, and unexcelled for ventilating schools, churches, mills, factories, etc.

They Ventilate and prevent down draft and smoky chimneys.

Iron and Steel, Structural Iron, Galvanized Sheet Iron, "Coe Old Style" Roofing Plate, Corrugated Sheet Iron, Heavy Hardware.

WE wish to call attention to the line of goods for which we are able at all times to quote most advantageous prices.

Our specialty is the manufacture of HIGH QUALITY ROOFING PLATES, and our Brands are known as the standard in their respective grades.

ROOFING TIN PLATE—BRANDS.

"Scott's Extra Coated".	"ABSOLUTELY THE BEST" 47 lbs. coating, and guaranteed to an extent unparalleled in the trade. Net weight, IC, 20 x 28, 240 lbs.
"Triumph Old Method".	Strictly Hand Dipped, Palm Oil process throughout, 38 lbs. coating. Greatly superior to other makers' best qualities. Net weight, IC, 20 x 28, 230 lbs.
"Protection Old Process"	A great favorite; bright clean finish, heavily mottled, 40 lbs. coating. Net weight, IC, 20 x 28, 230 lbs.
"Old Reliable Re-dipped"	Dull oil finish, well mottled, 36 lbs. coating. Very much preferred to the M. F. Brand, which is standard of best quality Welsh plate. Net weight, IC, 20 x 28, 230 lbs.
"Neville Old Style" . .	Very bright, clean and handsomely mottled, 26 lbs. coating, exceptionally rich in pure BLOCK TIN. Net weight, IC, 20 x 28, 220 lbs.
"Duquesne"	The highest standard of rolled roofing plates, has taken the position in America heretofore occupied by the foreign "Worcester" brand. Full weight.
"Pittsburg"	Next quality to Duquesne, and a favorite with many.
"Raymond"	A medium grade, suitable for ordinary work. Always sold at a very moderate price Full weight.
"Allegheny"	The lowest priced roofing plate we have to offer. You will be agreeably surprised at its quality, taking into consideration its low cost.

BRIGHT TIN PLATE—BRANDS.

"Finest" .	The very best Bright Charcoal Tin. Superb coating, perfectly cleaned, closely assorted. "Finest" in name and quality.
"Clifton" .	An excellent plate, well coated. "Melyn" grade.
"Furnace" .	Medium quality, regular and light weights, also special sizes for Heater Pipe.

"FINEST" and "CLIFTON" brands in IC to IXXXX, 14 x 20 and 20 x 28, and also in many odd sizes.

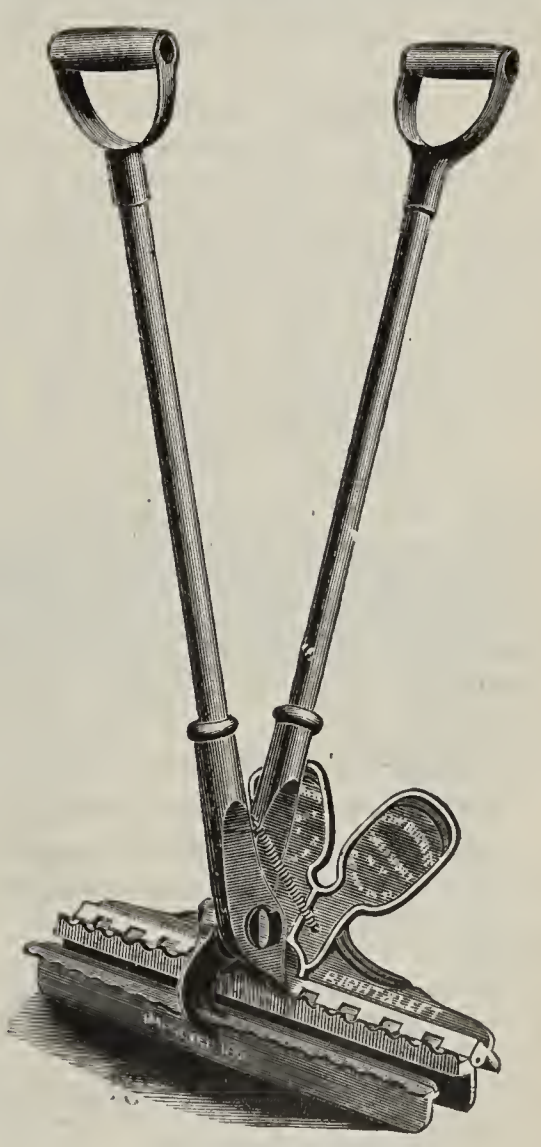
STOVES, TINWARE AND KITCHEN HARDWARE.
Gasoline Stoves a Specialty.

MINNEAPOLIS, MINN., Dec. 9th.

DOUBLE TRUSS CORNICE BRAKE CO.,
BUFFALO, N. Y.

Gentlemen:—Enclosed please find N. Y. Exchange for $—— to pay for Cornice Brake sent us about six weeks ago. We never paid a bill for tools where we thought we came as near getting our money's worth as we do in paying you for this Brake. The machine is all right, and all you claim for it.

The Brake is now in a distant part of this state where our men are putting in a job of large square galv. piping. Should it get in a wreck and be lost to us, we would order another just like it at once.



All the boys in the shop are anxious to know when that Brake is coming back. For our use we would rather have this than an iron one. We are, Very respectfully yours, LUCAS BROTHERS.

All Sizes from 3 ft. to 10 ft. Indispensable to Cornice makers, roofers, tinsmiths, furnace men, etc.
Send for our latest prices.

BRIDGEPORT, CONN.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

OWNERS OF THE STILES AND PARKER PRESS CO.

"BLISS" AUTOMATIC BUFFING MACHINE No. 280.

By means of this machine a boy will buff the sides and faces of screw caps at the rate of forty to sixty per minute, according to the degree of polish to be obtained. The chucks shown are intended for Mason Jar Tops, but others may be substituted, making the machine available for the sockets of incandescent lights and other similar goods. The caps are automatically removed from the chucks after buffing.

Size of T. & L. pulleys on counter-shaft (300 revolutions).....20 x 6¼ inches.
Weight, with counter-shaft.....1,275 pounds.
Floor-space over all.....40 x 48 inches.

WRITE FOR FURTHER PARTICULARS.

No. 280 "BLISS" AUTOMATIC BUFFING MACHINE.

DAVID WILLIAMS COMPANY,
PUBLISHERS AND BOOKSELLERS,
232-238 William Street, - NEW YORK.

—ONE of the public drinking-places erected by the Philadelphia Fountain Society is embellished by a rather unique design, in the form of a man's face. It is rather grotesque in appearance, and this effect is heightened by the fact that the water comes gushing forth from the mouth of the stone figure. Two Chinamen, evidently the proprietors of laundries, stopped in front of the fountain yesterday afternoon and seemed deeply interested in it. They cocked their funny little heads to one side, gazed at the spectacle from every possible point of view, and, after a moment of contemplative silence, proceeded to pass critical judgment upon it. "Him squirtee belly good," said one. "Yes," replied the other, "me likee havee him all alongee my laundry."—*Philadelphia Record.*

QUICK MEAL

BLUE FLAME OIL STOVES.

15 POINTS OF SUPERIORITY OF THE "QUICK MEAL" BLUE FLAME OIL STOVES.

1. The "Quick Meal" lights quicker and its flame is ready for duty quicker than any other stove.

2. The "Quick Meal" Brass Tank is composed of only **two pieces**. These two pieces are jointed together by a **single seam**, and that single seam **is absolutely tight**, because it is made on a machine specially built to do this work only. **It is leak proof.**

3. The "Quick Meal" has perforated cylinders which can be removed easily and instantly by withdrawing two bolts and replaced at a nominal cost.

4. The "Quick Meal's" upper Burner Drum is made of soft, smooth, cold rolled steel and protected by a coat of Japan out—as well as inside.

5. The "Quick Meal" has the perforations in its cylinders made by a special die, which leaves them smooth all over and easy to clean.

TO BE CONTINUED IN NEXT ISSUE.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR :
In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal
Very truly,
I. N. EVANS.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

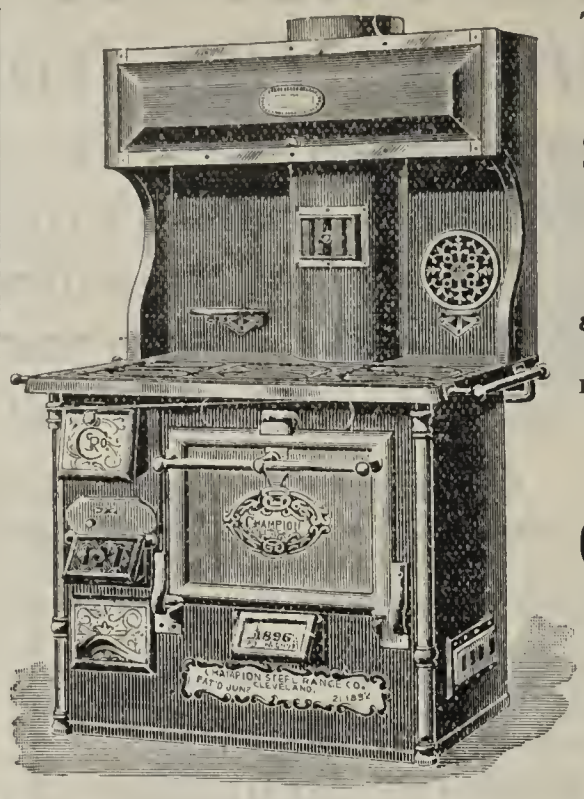
The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*



Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

NOTHING SUCCEEDS LIKE SUCCESS,

hence the unqualified success others have experienced with the

CLIMAX CELLAR DRAINER

should induce you to use it also. Your customers need This Drainer, and you should write to-day for circular and prices, because it is the Plumber best qualified to do intelligently and satisfactorily all classes of work who meets with the greatest success and therefore the success of the

Climax Cellar Drainer

is your success also.

Years of effort have enabled us to produce a Drainer of marvelous perfection, entirely free from stuffing boxes, springs, packings and washers; a result not accomplished by any other manufacturer.

The simplicity, reliability and superiority of the **Climax Cellar Drainer** are proverbial.

Sold by all Jobbers.
